Building an Application

Prerequisites

- You have integrated SAM
- You have set up appropriate environments and service pools

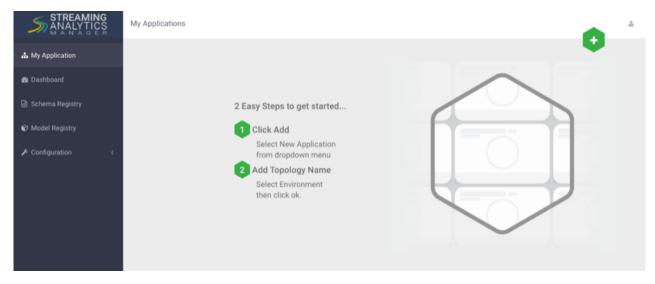

Launch the Stream Builder UI

Procedure

- 1. In Ambari, select Streaming Analytics Manager from the left-hand Services pane.
- 2. Under Quick Links, select SAM UI.

Results

The SAM Stream Builder UI displays. You can return at any time by clicking **My Applications** from the left-hand menu.

Add a New Stream Application

Note:

Procedure

1. Specify the name of the stream application and the environment you want to use.

The name of the stream app should not have any spaces.

| Add Stream | × |
|-------------------------------|-----------|
| NAME • | |
| Trucking-IOT-Stream-Analytics | |
| ENVIRONMENT . | |
| Dev | * |
| | Cancel Ok |

2. SAM displays the Stream Builder canvas. Builder components on the canvas palette are the building blocks you use to build stream apps. Refer to the *HDF Overview* for information about each component building block.

| | application | | |
|---------------|-------------------------------------|------------------------------------|------------------------|
| Q (8) | | Last Change:0s ago Version:CURRENT | |

| <u> </u> | | streaming engine | |

Add a Source

As described in the *HDF Overview*, Stream Builder offers four types of builder components: sources, processors, sinks, and custom components. Start building your application by adding a source.

Before you begin

You have configured Schema Registry and integrated with SAM.

Procedure

1. Drag a source builder component, Kafka for example, onto the canvas. This creates a Kafka tile component:

| 5 | My Applie | cations / IOT-Trucking-Ref-App | | | | |
|-------------|--------------------|--|--|------------------------|-----------------|---------|
| " | Q 🕼 | | | Last Change:2m 59s ago | Version:CURRENT | ତ୍ ର୍ 🌣 |
| £ 2a | EVENT HUBS | Kafka source tile | | | | |
| Ф | COP HDFS | Ļ | | | | |
| Ŷ | <mark>8</mark> 8 | & KAFKA | Gray dot indicates that the build component is not configured | | | |
| pe | KAFKA PROCESSOR | Click the arrows to | | | | |
| | Σ | increase or decrease the number of builder component instances | | | | |
| | | for performance and scalability needs | | | | |
| | BRANCH | | | | | |
| | >+ | | | | | |
| | JOIN | | | | | |

2. Double-click the tile to begin configuring Kafka. After you specify a Kafka topic name, SAM communicates with Schema Registry and displays the schema:

| TruckGeoEvent | Kafka connection setting populated by SAM based Kafka service in Environme | on the X |
|-----------------------------|--|-----------------------------|
| REQUIRED OPTIONAL N | OTES the Service Pool | |
| CLUSTER NAME * | | Output |
| streamanalytics | • | STRING |
| SECURITY PROTOCOL * | | truckId* |
| PLAINTEXT | | driverId* |
| | | driverName* |
| BOOTSTRAP SERVERS * | | routeld* |
| secure-fenton-hdf5.field.ho | ortonworks.com:6667,secure | INTEGER route* STRING |
| KAFKA TOPIC * | | eventType* string |
| truck_events_avro | ▼ | latitude* DOUBLE |
| CONSUMER GROUP ID * | | longitude* |
| truck_geo_event_1 | | correlationId* |
| | | geoAddress string |
| SAM fetch | select a Kafka topic, nes the topic schema Schema Registry | Cancel Ok |

3. Add the additional components you want to use to develop your stream app.

Results

When you have added and correctly configured your stream app components, the component tile displays a green dot on the left. You cannot connect a source to different processors or sinks until it is correctly configured.

Connect Components

Once you have added and configured your source, add additional processors and sinks to the canvas. To pass a stream of events from one component to the next, create a connection between the two components. In addition to defining data flow, connections allow you to pass a schema from one component to another.

Before you begin

You have added and configured at least one source.

Procedure

1. Click the green dot to the left of your source component.

2. Drag your cursor to the component tile to which you want to connect.

Join Multiple Streams

Joining multiple streams is an important SAM capability. You accomplish this by adding the Join processor to your stream application.

Procedure

- 1. Drag a Join processor onto your canvas and connect it to a source.
- 2. Double click the Join tile to open the **Configuration** dialog.
- 3. Configure the Join processors according to your streaming application requirements.

Example

| JOIN | Join stream_1 on fi | eld driverld | | | Wait 5 seconds for |
|--|--|------------------------------|------------------------|---|--|
| CONFIGURATION NOTES | | | | streams to catch up before the join occurs | |
| Input | kafka_stream_1 🔹 | driverId - | Ļ | | Output |
| kafka_stream_1 eventTime* streng | JOIN TYPE | SELECT STREAM kafka_stream_2 | SELECT FIELD | WITH STREAM | INTEGER driverId* INTEGER driverName* STRING |
| eventSource* stravG truckId* INTEGER driverId* | WINDOW INTERVAL TYPE* | | | • | routeld* INTEGER route* STRING eventType* |
| INTEGER driverName* strang routeId* INTEGER | WINDOW INTERVAL* | Seconds - | SLIDING INTERVAL | Seconds - | stave Jatitude* Double Iongitude* Double |
| route* strang eventType* strang | OUTPUT FIELDS* X eventTime × eventSource | ce × truckld × driverld × | driverName × routeId × | SELECT ALL | correlationId* LONG geoAddress |
| Intitude* DOUBLE Iongitude* DOUBLE | × latitude × longitude | × correlationId × geoAddress | × speed | | STRING speed* INTEGER |
| correlationId* | | | | The output of the joins | Cancel Ok |

Filter Events in a Stream

You can use SAM to filter events in the stream. You accomplish this by using Rule processor, which translates rules into SQL queries that operate on the stream of data.

Procedure

1. Drag the Rule processor to the canvas and connect it to the Join processors.

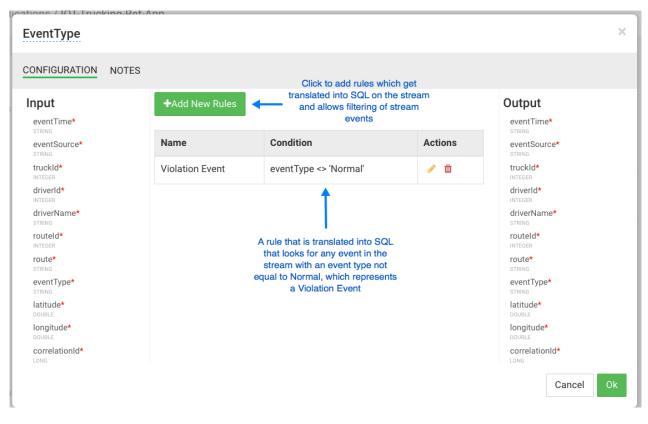

| 5 | My Applic | ations / IOT-Trucking-Ref-App | | | | | |
|---|---------------|--------------------------------|---|-----------------|----------------------------|-----------------|--------|
| | Q Ø | | | | Last Change: 0s ago | Version:CURRENT | ତ୍ତ୍ 🗢 |
| æ | SOURCE | | Drag the Rule proce the palette and conn | ect it to the | | | |
| | EVENT HUBS | | Join proces | sor | | | |
| ு | 1 and a start | | | | | | |
| Ø | HDFS | <pre>% TruckGeoEv ∢ 01 ▶</pre> | | | | | |
| ŗ | KAFKA | | 401 ▶ • - → • ● ■ RULE RULE | 4 01 ▶ ● | | | |
| - | PROCESSOR | KAFKA € 01 € | | | | | |
| | | | | | | | |
| | | | | | | | |
| | BRANCH | | | | | | |
| | >+ | | | | | | |
| | JOIN | | | | | | |

2. Double click the Rule processor, click the + Add New Rules button, and create a new rule:

| Add New Rule | | | | | | | × |
|-----------------------|-------------------------|----------|-----------|-----|----------|--------|----|
| RULE NAME* | | | | | | | |
| Violation Event | | | | | | | |
| DESCRIPTION* | | | | | | | |
| Events that are infra | actions from drivers an | d trucks | | | | | / |
| CREATE QUERY* | eventType | × • | NOT_EQUAL | × • | 'Normal' | × 👻 + | |
| QUERY PREVIEW: | | | | | | | |
| eventType < 'No | ormal' | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | | |
| | | | | | | Cancel | Ok |

3. Click **Ok** to save the new rule.

Example

Use Aggregate Functions over Windows

Windowing is the ability to split an unbounded stream of data into finite sets based on specified criteria such as time or count, so that you can perform aggregate functions (such as sum or average) on the bounded set of events. In SAM, you accomplish this using the Aggregate processor. The Aggregate processor supports two window types, tumbling and sliding windows. You can create a window based on time or count.

Procedure

- 1. Drag the Aggregate processor to the canvas and connect it to the stream application you are building.
- 2. Double click the Aggregate tile to configure it according the your stream application requirements.

Example

| / IOT Trucking Dof App | | | | | _ |
|-----------------------------------|---------------------------------|--|---------------|-----------------------|----|
| DriverAvgSpeed | | At the end of the window, this | | | × |
| CONFIGURATION NOTES | The fields to group by | is the new schema that will be output to the stream: the average speed of every driver | <u>></u> , | | |
| Input | SELECT KEYS* | average speed or every unver | | Output | |
| | × driverId × driverName × route | | × • | driverId* | |
| driverId* | WINDOW INTERVAL TYPE* | | | driverName* string | |
| driverName* STRING | Time | | - | route* STRING | |
| routeld* | WINDOW INTERVAL* | | | speed_AVG* | |
| route* STRING | 3 | Minutes 👻 | | | |
| eventType* string latitude* | SLIDING INTERVAL | | | | |
| longitude* | 3 | Minutes - | | | |
| correlationId* | TIMESTAMP FIELD | | | | |
| geoAddress* STRING | processingTime × 💌 | | | | |
| speed* INTEGER | Output Fields | | | | |
| | | | | Cancel | Ok |

Deploying a Stream App

Configure Deployment Settings

Before deploying the application, it is important to configure deployment settings such as JVM size, number of ackers, and number of workers.

Because this topology uses a number of joins and windows, you should increase the JVM heap size for the workers. Click the gear icon on the top right corner of the canvas, and increase the number of workers (e.g.: 5) and increase the JVM heap memory (-Xmx3072m).

| Topology Configuration | > |
|------------------------------------|---|
| NUMBER OF WORKERS | |
| 5 | |
| NUMBER OF ACKERS | |
| 1 | |
| TOPOLOGY MESSAGE TIMEOUT (SECONDS) | |
| 40 | |
| WORKER JVM OPTIONS | |
| -Xmx3072m | |
| HBase config | |
| HBASE ROOT DIRECTORY * | |
| hdfs://localhost:9000/tmp/hbase | |
| | |
| | |
| | |

Deploy the App

After the app's deployment settings has been configured, click the Deploy button on the lower right of the canvas. During the deployment process, Streaming Analytics Manager completes the following tasks:

Procedure

- 1. Construct the configurations for the different big data services used in the stream app.
- 2. Create a deployable jar of the streaming app.
- 3. Upload and deploy the app jar to streaming engine server.

Results

The stream app is deployed to a Storm cluster based on the Storm Service defined in the Environment associated with the app.
