Creating your first Streams Messaging cluster

You can create a managed and secured Streams Messaging cluster in a CDP Public Cloud environment by using one of the prescriptive streams messaging cluster definitions and following these steps.

Meet the prerequisites

Before you start creating your first Streams Messaging Data Hub Cluster, you need to ensure that you have set up the environment properly and have all the necessary accesses to use CDP Public Cloud. Use this checklist to make sure that you meet all the requirements before you start creating your first cluster.

- You have CDP login credentials.
- You have an available CDP environment.
- You have a running Data Lake.
- You have a CDP username and the predefined resource role of this user is EnvironmentAdmin.
- Your CDP user is synchronized to the CDP Public Cloud environment.
- Your CDP user has the correct permissions set up in Ranger allowing access to Kafka, Streams Messaging Manager and Schema Registry.

Important: Make sure that the Runtime version of the Data Lake cluster matches the Runtime version of the Data Hub cluster that you are about to create. If these versions do not match, you may encounter warnings and/or errors.

Create your cluster

Once you have met the prerequisites, you are ready to create your Streams Messaging cluster in CDP Public Cloud using a default cluster definition. For this, you must select the cluster definition that matches your cloud provider for the environment and further choose from the light and heavy duty options available.

Procedure

1. Log into the CDP web interface.
2. Navigate to Management Console Environments, and select the environment where you would like to create a cluster.

3. Click Create Data Hub.

The following page is displayed:

4. Select Cluster Definition.

5. Select the appropriate streams messaging cluster definition from the Cluster Definition dropdown depending on your operational objectives.

There are two definition options available:

- Streams Messaging Heavy Duty for AWS
- Streams Messaging Light Duty for AWS
- Streams Messaging Heavy Duty for Azure
- Streams Messaging Light Duty for Azure

For more information on templates, see [Planning your Streams Messaging deployment](#).

The list of services is automatically shown below the selected cluster definition name.

6. Give the cluster a name and add any tags you might need.

You can define tags that will be applied to your cluster-related resources on your cloud provider account. For more information about tags, see [Tags](#).

7. Optionally, use the Configure Advanced Options section to customize the infrastructure settings.

8. Click Provision Cluster.

Results

You will be redirected to the Data Hub cluster dashboard, and a new tile representing your cluster will appear at the top of the page.

Give users access to your cluster

As an EnvironmentAdmin, you need provide the users access to your environment and to the new Streams Messaging cluster by assigning user roles and adding users to Ranger policies.

About this task

The cluster you have created using the Streams Messaging cluster definition is kerberized and secured with SSL. Users can access cluster UIs and endpoints through a secure gateway powered by Apache Knox. Before you can begin working with Kafka, Schema Registry, and Streams Messaging Manager, you must give users access to the Streams Messaging cluster components.

Procedure

1. Assign the EnvironmentUser role to the users to grant access to the CDP environment and the Streams Messaging cluster.
2. Sync the updated user permissions to the Data Lake (Ranger) using ActionsSynchronize Users to FreeIPA.
This synchronizes the user to the FreeIPA identity management system to enable SSO.
3. Add the user to the appropriate pre-defined Ranger policies.
These policies are specified within the Ranger instance that provides authorization to the Kafka service in your Streams Messaging cluster.
If needed, you can also create a custom Ranger access policy and add the user to it.

Next steps

After you have created your Streams Messaging Data Hub cluster, you are ready to start working with Kafka workloads in CDP Public Cloud. You can gather information about Kafka and Streams Messaging details in other parts of the CDP Public Cloud documentation.
