Overview of Oozie

Apache Oozie Workflow Scheduler for Hadoop is a workflow and coordination service for managing Apache Hadoop jobs:

- Oozie Workflow jobs are Directed Acyclic Graphs (DAGs) of actions; actions are Hadoop jobs (such as MapReduce, Streaming, Hive, Sqoop and so on) or non-Hadoop actions such as Java, shell, Git, and SSH.
- Oozie Coordinator jobs trigger recurrent Workflow jobs based on time (frequency) and data availability.
- Oozie Bundle jobs are sets of Coordinator jobs managed as a single job.

Oozie is an extensible, scalable and data-aware service that you can use to orchestrate dependencies among jobs running on Hadoop.

Related Information

[Apache Oozie Workflow Scheduler for Hadoop](#)

Adding the Oozie service using Cloudera Manager

The Oozie service can be automatically installed and started during your installation of CDP with Cloudera Manager. If required, you can install Oozie manually with the Add Service wizard in Cloudera Manager. The wizard configures and starts Oozie and its dependent services.

Note: If your instance of Cloudera Manager uses an external database, you must also configure Oozie with an external database.

Considerations for Oozie to work with AWS

If you want to access Amazon Web Services (AWS) S3 data through Oozie, then ensure that the required AWS credentials are configured in `core-site.xml`.

User authorization configuration for Oozie

Learn about user authorization model for Oozie and Access Control List (ACL). Also, learn about how to define admin users for Oozie jobs and ACL.

Oozie has a basic authorization model which is as follows:

- Users have read access to all jobs
- Users have write access to their own jobs
- Users have write access to jobs based on an ACL, which is a list of users and groups
- Users have read access to admin operations
- Admin users have write access to all jobs
- Admin users have write access to admin operations

If security is disabled all users are admin users.

Oozie security is set through the following configuration property, which is false by default:

```
oozie.service.AuthorizationService.security.enabled=false
```

Note: The old ACL model where a group was provided is still supported if the following property is set in the `oozie-site.xml` file:

```
oozie.service.AuthorizationService.default.group.as.acl=true
```

Defining admin users

Admin users are determined from the list of admin groups, specified in the `oozie.service.AuthorizationService.admin.groups` property. Use commas to separate multiple groups. Spaces, tabs, and ENTER characters are trimmed.

If the above property for admin groups is not set, then you can define the admin users in the following manner. The list of admin users can be in the `conf/adminusers.txt` file. The syntax of this file is as follows:

- One user name per line
- Empty lines and lines starting with # are ignored

Admin users can also be defined in the `oozie.serviceAuthorizationService.admin.users` property. Use commas to separate multiple admin users. Spaces, tabs, and ENTER characters are trimmed.

In case there are admin users defined using both methods, the effective list of admin users will be the union of the admin users found in the `adminusers.txt` file and those specified with the `oozie.serviceAuthorizationService.admin.users` property.

Defining access control lists

ACLs are defined in the following ways:

- workflow job submission over CLI
Configuration property `group.name` of `job.properties`.
- workflow job submission over HTTP
Configuration property `group.name` of the XML submitted over HTTP.
- workflow job re-run
Configuration property `oozie.job.acl` (preferred) or configuration property `group.name` of `job.properties`.
- coordinator job submission over CLI
Configuration property `oozie.job.acl` (preferred) or configuration property `group.name` of `job.properties`.
- bundle job submission over CLI
Configuration property `oozie.job.acl` (preferred) or configuration property `group.name` of `job.properties`.

For all other workflow, coordinator, or bundle actions, the ACL set in beforehand are used as basis.

Once the ACL for the job is defined, Oozie checks over HDFS whether the user trying to perform a specific action is part of the necessary group(s). For implementation details, check out `org.apache.hadoop.security.Groups#getGroups(String user)`.

Note that it is enough that the submitting user be part of at least one group of the ACL. Note also that the ACL can contain user names as well. If there is an ACL defined and the submitting user is not part of any group or user name present in the ACL, an `AuthorizationException` is thrown.

Example: A typical ACL setup

Detail of `job.properties` on workflow job submission:

```
user.name=joe  
group.name=marketing,admin,qa,root
```

HDFS group membership of HDFS user `joe` is `qa`. That is, the check to `org.apache.hadoop.security.Groups#getGroups("joe")` returns `qa`. Hence, ACL check passes inside

AuthorizationService, because the user.name provided belongs to at least one of the ACL list elements provided as group.name.

Redeploying the Oozie ShareLib

Some Oozie actions – specifically DistCp, Streaming, Sqoop, and Hive – require external JAR files in order to run. Instead of having to keep these JAR files in each workflow's lib folder, or forcing you to manually manage them using the oozie.libpath property on every workflow using one of these actions, Oozie provides the ShareLib.

The ShareLib behaves very similarly to oozie.libpath, except that it is specific to the aforementioned actions and their required JARs.

Redeploying the Oozie sharelib using Cloudera Manager

When you switch between MapReduce and YARN computation frameworks, you must redeploy the Oozie ShareLib.

About this task

Procedure

1. Go to the Oozie service.
2. Select Actions Install Oozie ShareLib .

Oozie configurations with CDP services

You can configure Oozie to work with different CDP services.

Some of the different services for which you can configure Oozie are as follows:

- Using Sqoop actions with Oozie
- Enabling MapReduce jobs controlled by Oozie to read from or write to Amazon S3 or Microsoft Azure ADLS
- Configuring Oozie to use HDFS HA

Using Sqoop actions with Oozie

There are certain recommendations that you must consider for using Sqoop actions with Oozie.

Note: Sqoop1 does not ship with third party JDBC drivers. You must download them separately and save them to the /var/lib/sqoop/ directory on the Oozie server.

Recommendations for using Sqoop actions with Oozie

- Cloudera recommends that you not use Sqoop CLI commands with an Oozie Shell Action. Such deployments are not reliable and prone to breaking during upgrades and configuration changes.
- To import data into Hive, use a combination of a Sqoop Action with a Hive2 Action.
 - A Sqoop Action to simply ingest data into HDFS.
 - A Hive2 Action that loads the data from HDFS into Hive.

Deploying and configuring Oozie Sqoop1 Action JDBC drivers

You must deploy and configure the Oozie Sqoop1 action JDBC drivers on HDFS.

Before you begin

Confirm that your Sqoop1 JDBC drivers are present in `/var/lib/sqoop`.

Procedure

- SSH to the Oozie server host and run the following commands to deploy and configure the drivers on HDFS.

```
cd /var/lib/sqoop
sudo -u hdfs hdfs dfs -mkdir /user/oozie/libext
sudo -u hdfs hdfs dfs -chown oozie:oozie /user/oozie/libext
sudo -u hdfs hdfs dfs -put /opt/cloudera/parcels/SQOOP_NETEZZA_CONNECTOR/sqoop-nz-connector*.jar /user/oozie/libext/
sudo -u hdfs hdfs dfs -put /opt/cloudera/parcels/SQOOP_TERADATA_CONNECTOR/lib/*.jar /user/oozie/libext/
sudo -u hdfs hdfs dfs -put /opt/cloudera/parcels/SQOOP_TERADATA_CONNECTOR/sqoop-connector-teradata*.jar /user/oozie/libext/
sudo -u hdfs hdfs dfs -put /var/lib/sqoop/*.jar /user/oozie/libext/
sudo -u hdfs hdfs dfs -chown oozie:oozie /user/oozie/libext/*.jar
sudo -u hdfs hdfs dfs -chmod 755 /user/oozie/libext/*.jar
sudo -u hdfs hdfs dfs -ls /user/oozie/libext
# [sample contents of /user/oozie/libext]
-rwxr-xr-x  3 oozie oozie      959987 2016-05-29 09:58 /user/oozie/libext/mysql-connector-java.jar
-rwxr-xr-x  3 oozie oozie      358437 2016-05-29 09:58 /user/oozie/libext/nzjdbc3.jar
-rwxr-xr-x  3 oozie oozie      2739670 2016-05-29 09:58 /user/oozie/libext/ojdbc6.jar
-rwxr-xr-x  3 oozie oozie      3973162 2016-05-29 09:58 /user/oozie/libext/sqoop-connector-teradata-1.5c5.jar
-rwxr-xr-x  3 oozie oozie        41691 2016-05-29 09:58 /user/oozie/libext/sqoop-nz-connector-1.3c5.jar
-rwxr-xr-x  3 oozie oozie         2405 2016-05-29 09:58 /user/oozie/libext/tdgssconfig.jar
-rwxr-xr-x  3 oozie oozie      873860 2016-05-29 09:58 /user/oozie/libext/terajdbc4.jar
```

Configuring Oozie Sqoop1 Action workflow JDBC drivers

You must confirm that the Sqoop1 JDBC drivers are present in HDFS and then configure the required variables.

Procedure

- Confirm that the Sqoop1 JDBC drivers are present in HDFS. To do this, SSH to the Oozie Server host and run the following command:

```
sudo -u hdfs hdfs dfs -ls /user/oozie/libext
```

- Configure the following Oozie Sqoop1 Action workflow variables in Oozie's `job.properties` file as follows:

```
oozie.use.system.libpath = true
oozie.libpath = /user/oozie/libext
```

Configuring Oozie to enable MapReduce jobs to read or write from Amazon S3

MapReduce jobs controlled by Oozie as part of a workflow can read from and write to Amazon S3.

Before you begin

You will need your AWS credentials (the appropriate Access key ID and Secret access key obtained from Amazon Web Services for your Amazon S3 bucket). After storing these credentials in the keystore (the JCEKS file), specify the path to this keystore in the Oozie workflow configuration.

About this task

This setup is for use in the context of Oozie workflows only, and does not support running shell scripts on Amazon S3 or other types of scenarios.

Note: In the following steps, replace the *path/to/file* with the HDFS directory where the .jceks file is located, and replace *access_key_ID* and *secret_access_key* with your AWS credentials.

Procedure

1. Create the credential store (.jceks) and add your AWS access key to it as follows:

```
hadoop credential create fs.s3a.access.key -provider \
jceks://hdfs/path/to/file.jceks -value access_key_id
```

For example:

```
hadoop credential create fs.s3a.access.key -provider \
jceks://hdfs/user/root/awskeyfile.jceks -value AKIAIPVYH....
```

2. Add the AWS secret to this same keystore.

```
hadoop credential create fs.s3a.secret.key -provider \
jceks://hdfs/path/to/file.jceks -value secret_access_key
```

3. Set `hadoop.security.credential.provider.path` to the path of the .jceks file in Oozie's workflow.xml file in the MapReduce Action's <configuration> section so that the MapReduce framework can load the AWS credentials that give access to Amazon S3.

```
<action name="S3job">
  <map-reduce>
    <job-tracker>${jobtracker}</job-tracker>
    <name-node>${namenode}</name-node>
    <configuration>
      <property>
        <name>hadoop.security.credential.provider.path</name>
        <value>jceks://hdfs/path/to/file.jceks</value>
      </property>
      ....
      ....
    </configuration>
  </map-reduce>
</action>
```

Configuring Oozie to use HDFS HA

To configure an Oozie workflow to use HDFS HA, use the HDFS nameservice instead of the NameNode URI in the <name-node> element of the workflow.

Example:

```
<action name="mr-node">
  <map-reduce>
    <job-tracker>${jobTracker}</job-tracker>
```

```
<name-node>hdfs://ha-nn</name-node>
```

where *ha-nn* is the value of `dfs.nameservices` in `hdfs-site.xml`.

Related Information

[Additional considerations when configuring TLS/SSL for Oozie HA](#)

Using Hive Warehouse Connector with Oozie Spark Action

Hive and Spark use different Thrift versions which are not compatible with each other. If you have the Hive Warehouse Connector (HWC) JAR in Oozie's Spark classpath, there will be conflicting Hive classes. This is because it can come from Oozie's default Spark classpath with the original signature and also from the HWC JAR with the changed signature because of the shading process.

About this task

Hive and Spark use different Thrift versions and are incompatible with each other. Upgrading Thrift in Hive is complicated and may not be resolved in the near future. Therefore, Thrift packages are shaded inside the HWC JAR to make Hive Warehouse Connector work with Spark and Oozie's Spark action.

This shading process changes the signature of some Hive classes inside the HWC JAR because the HWC JAR is a fat JAR and contains Hive classes as well. Oozie's Spark action also has Hive libraries on its classpath (added as part of the Cloudera stack) because you can run simple Hive commands with Oozie's Spark action (not with HWC but on its own). You can also run Hive actions with Hive Warehouse Connector through Oozie's Spark action.

You can resolve this issue using one of the following options:

Note: The below methods will only work in Cloudera Runtime 7.1.5.x or earlier versions. If you are using CDP 7.1.6.x or later, due to a known issue, these methods do not work. You must create a support case to get the hotfix until this issue is fixed in a future release.

Procedure

- If you are only using HWC with Oozie's Spark action and not executing simple Hive commands, you can place the HWC JAR in Oozie's Spark ShareLib. You can then remove all other Hive JARs from Oozie's Spark ShareLib.
- or
- If you are executing both simple Hive commands and using HWC through Oozie's Spark action, placing the HWC JAR in Oozie's Spark ShareLib is not recommended. You must choose a different option offered by Oozie like placing it next to the `workflow.xml` or placing it on HDFS and specifying it in the `workflow.xml` using a `<file>` tag and so on. In this case, you should exclude the other Hive JARs from the classpath when running an Oozie-Spark-HWC action. You can achieve this by adding the following in the `job.properties` file for your workflow:

```
oozie.action.ShareLib.for.spark.exclude=^.*\hive\-(?!warehouse-connector).*\.jar$
```

Related Information

[Hive Warehouse Connector for accessing Apache Spark data](#)

Oozie High Availability

Oozie High Availability is "active-active" so that both Oozie servers are active at the same time, with no failover. High availability for Oozie is supported in both MRv1 and MRv2 (YARN).

Requirements for Oozie High Availability

You must ensure your cluster meets all the requirements for configuring Oozie High Availability (HA).

- Multiple active Oozie servers, preferably identically configured.
- JDBC JAR in the same location across all Oozie hosts (for example, `/var/lib/oozie/`).
- External database that supports multiple concurrent connections, preferably with HA support.
- ZooKeeper ensemble with distributed locks to control database access, and service discovery for log aggregation.
- Load balancer (preferably with HA support, for example [HAProxy](#)), virtual IP, or round-robin DNS to provide a single entry point (of the multiple active servers), and for callbacks from the Application Master or JobTracker.

Configuring Oozie High Availability using Cloudera Manager

You can use Cloudera Manager to enable or disable Oozie High Availability (HA).

Important: Enabling or disabling HA makes the previous monitoring history unavailable.

Oozie Load Balancer configuration

To enable Oozie High Availability, you must manually configure a Load Balancer.

About this task

Cloudera recommends using the HAProxy Load Balancer. These steps explain how to configure the HAProxy load balancer. However, you can choose to configure a different Load Balancer.

Procedure

1. Install HAProxy on the host where you are setting up and configuring the Oozie load balancer. For more information, see the [HAProxy documentation](#).
2. You must configure the Oozie load balancer for both HTTP and HTTPS ports.

```
This is an example:
global
    log                127.0.0.1 local2
    pidfile            /var/run/haproxy.pid
    maxconn            4000
    user               haproxy
    group              haproxy
    daemon
    stats              socket /tmp/haproxy

defaults
    mode                http
    log                 global
    option              httplog
    option              dontlognull
    option forwardfor   except 127.0.0.0/8
    option              redispatch
    retries             3
    timeout http-request 10s
    timeout queue       1m
    timeout connect     10s
    timeout client      10m
    timeout server      10m
    timeout check       10s
    maxconn            3000
```

```

listen admin
    bind *:8000
    stats enable

#-----
# main frontend which proxys to the backends
#-----
frontend                                oozie_front
    bind                                 *:5000 ssl crt /var/lib/cloudera-scm-agent
    /agent-cert/cdep-host_key_cert_chain_decrypted.pem
    default_backend                       oozie

#-----
# round robin balancing between the various backends
#-----
backend oozie
    balance                               roundrobin
    server oozie1 my-oozie-host-1:11443/oozie check ssl ca-file /var/lib/
    cloudera-scm-agent/agent-cert/cm-auto-global_cacerts.pem
    server oozie2 my-oozie-host-2:11443/oozie check ssl ca-file /var/lib/
    cloudera-scm-agent/agent-cert/cm-auto-global_cacerts.pem
    server oozie3 my-oozie-host-3:11443/oozie check ssl ca-file /var/lib/
    cloudera-scm-agent/agent-cert/cm-auto-global_cacerts.pem

#-----
# main frontend which proxys to the http backends
#-----
frontend                                oozie_front_http
    bind                                 *:5002
    default_backend                       oozie_http

#-----
# round robin balancing between the various http backends
#-----
backend oozie_http
    balance                               roundrobin
    server oozie_http1 my-oozie-host-1:11000/oozie check
    server oozie_http2 my-oozie-host-2:11000/oozie check
    server oozie_http3 my-oozie-host-3:11000/oozie check

```

Using the example, the load balancer is setup for three Oozie instances. The load balancer listens on port 5002 for HTTP connections and forwards it to Oozie's port 11000. The load balancer listens on port 5000 for HTTPS connections and forwards it to Oozie's port 11443.

If you not enabled SSL in Oozie, then you do not need the HTTPS load balancer. For HTTPS load balancing, ensure that you set up the certificate.

3. Continue to configure the load balancer by enabling Oozie High Availability. For information about enabling Oozie High Availability, see [Enabling Oozie High Availability](#).

Enabling Oozie High Availability

You must select the host on which to install the additional Oozie server and specify the required property values to install Oozie High Availability (HA).

Before you begin

Ensure that the [requirements](#) are satisfied.

Procedure

1. In the Cloudera Manager Admin Console, go to the Oozie service.

2. Select **Actions Enable High Availability** to see eligible Oozie server hosts. The host running the current Oozie server is not eligible.
3. Select the host on which to install an additional Oozie server and click **Continue**.
4. Update the following fields for the Oozie load balancer:

- **Hostname**

For example:

```
nightly6x-1.vpc.cloudera.com
```

- **HTTP Port**

For example:

```
5002
```

- **HTTPS Port**

For example:

```
5000
```

5. Click **Continue**.

Cloudera Manager stops the Oozie servers, adds another Oozie server, initializes the Oozie server High Availability state in ZooKeeper, configures Hue to reference the Oozie load balancer, and restarts the Oozie servers and dependent services. In addition, Cloudera Manager generates Kerberos credentials for the new Oozie server and regenerates credentials for existing servers.

Disabling Oozie High Availability

Based on your requirements, you can disable Oozie High Availability (HA) using Cloudera Manager.

Procedure

1. In the Cloudera Manager Admin Console, go to the Oozie service.
2. Select **Actions Disable High Availability** to see all hosts currently running Oozie servers.
3. Select the one host to run the Oozie server and click **Continue**.

Cloudera Manager stops the Oozie service, removes the additional Oozie servers, configures Hue to reference the Oozie service, and restarts the Oozie service and dependent services.

Scheduling in Oozie using cron-like syntax

Most Linux distributions include the [cron](#) utility, which is used for scheduling time-based jobs. You can schedule Oozie using Cron-like syntax.

Location

Set the scheduling information in the frequency attribute of the coordinator.xml file. A simple file looks like the following example. The frequency attribute and scheduling information appear in bold.

```
<coordinator-app name="MY_APP" frequency="30 14 * * *"
start="2009-01-01T05:00Z" end="2009-01-01T06:00Z" timezone="UTC" xmlns="ur
i:oozie:coordinator:0.5">
  <action>
    <workflow>
      <app-path>hdfs://localhost:8020/tmp/workflows</app-path>
    </workflow>
```

```
</action>
</coordinator-app>
```

Syntax and structure

The cron-like syntax used by Oozie is a string with five space-separated fields:

- minute
- hour
- day-of-month
- month
- day-of-week

The structure takes the form of * * * * *. For example, 30 14 * * * means that the job runs at at 2:30 p.m. everyday. The minute field is set to 30, the hour field is set to 14, and the remaining fields are set to *.

Allowed values and special characters

The following table describes special characters allowed and indicates in which fields they can be used.

Table 1: Special characters

Character	Fields Allowed	Description
* (asterisk)	All	Match all values.
, (comma)	All	Specify multiple values.
- (dash)	All	Specify a range.
/ (forward slash)	All	Specify an increment.
? (question mark)	Day-of-month, day-of-week	Indicate no specific value (for example, if you want to specify one but not the other).
L	Day-of-month, day-of-week	Indicate the last day of the month or the last day of the week (Saturday). In the day-of-week field, 6L indicates the last Friday of the month.
W	Day-of-month	Indicate the nearest weekday to the given day.
# (pound sign)	Day-of-week	Indicate the nth day of the month

The following table summarizes the valid values for each field.

Field	Allowed Values	Allowed Special Characters
Minute	0-59	, - * /
Hour	0-23	, - * /
Day-of-month	0-31	, - * ? / L W
Month	1-12 or JAN-DEC	, - * /
Day-of-week	1-7 or SUN-SAT	, - * ? / L #

Important: Some cron implementations accept 0-6 as the range for days of the week. Oozie accepts 1-7 instead.

Oozie scheduling examples

You can use cron scheduling in Oozie to ensure that the jobs run according to the criteria that you specify.

The following examples show cron scheduling in Oozie. Oozie's processing time zone is UTC. If you are in a different time zone, add to or subtract from the appropriate offset in these examples.

Run at the 30th minute of every hour

Set the minute field to 30 and the remaining fields to * so they match every value.

```
frequency="30 * * * *"
```

Run at 2:30 p.m. every day

Set the minute field to 30, the hour field to 14, and the remaining fields to *.

```
frequency="30 14 * * *"
```

Run at 2:30 p.m. every day in February

Set the minute field to 30, the hour field to 14, the day-of-month field to *, the month field to 2 (February), and the day-of-week field to *.

```
frequency="30 14 * 2 *"
```

Run every 20 minutes between 5:00-10:00 a.m. and between 12:00-2:00 p.m. on the fifth day of each month

Set the minute field to 0/20, the hour field to 5-9,12-13, the day-of-month field to 0/5, and the remaining fields to *.

```
frequency="0/20 5-9,12-13 0/5 * *"
```

Run every Monday at 5:00 a.m.

Set the minute field to 0, the hour field to 5, the day-of-month field to ?, the month field to *, and the day-of-week field to MON.

```
frequency="0 5 ? * MON"
```

Note: If the ? was set to *, this expression would run the job every day at 5:00 a.m., not just Mondays.

Run on the last day of every month at 5:00 a.m.

Set the minute field to 0, the hour field to 5, the day-of-month field to L, the month field to *, and the day-of-week field to ?.

```
frequency="0 5 L * ?"
```

Run at 5:00 a.m. on the weekday closest to the 15th day of each month

Set the minute field to 0, the hour field to 5, the day-of-month field to 15W, the month field to *, and the day-of-week field to ?.

```
frequency="0 5 15W * ?"
```

Run every 33 minutes from 9:00-3:00 p.m. on the first Monday of every month

Set the minute field to 0/33, the hour field to 9-14, the day-of-week field to 2#1 (the first Monday), and the remaining fields to *.

```
frequency="0/33 9-14 ? * 2#1"
```

Run every hour from 9:00 a.m.-5:00 p.m. on weekdays

Set the minute field to 0, the hour field to 9-17, the day-of-month field to ?, the month field to *, and the day-of-week field to 2-6.

```
frequency="0 9-17 ? * 2-6"
```

Run on the second-to-last day of every month

Set the minute field to 0, the hour field to 0, the day-of-month field to L-1, the month field to *, and the day-of-week field to ?.

```
frequency="0 0 L-1 * ?"
```

Note: “L-1# means the second-to-last day of the month.

Oozie uses [Quartz](#), a job scheduler library, to parse the cron syntax. For more examples, go to the [CronTrigger Tutorial](#) on the Quartz website. Quartz has two fields (second and year) that Oozie does not support.

Configuring an external database for Oozie

Oozie is a stateless web application by design. All information about running and completed workflows, coordinators, and bundle jobs are stored in a relational database. Oozie supports an embedded PostgreSQL database; however, Cloudera strongly recommends that you use an external database for production systems.

Related Information

[Oozie database configurations](#)

Configuring PostgreSQL for Oozie

You must install PostgreSQL, create the Oozie user and database, and configure PostgreSQL to accept network connections for the Oozie user.

Procedure

1. Install PostgreSQL
See the PostgreSQL documentation to install it.
2. Create the Oozie User and Oozie Database.

For example, using the PostgreSQL psql command-line tool:

```
$ psql -U postgres
Password for user postgres: *****

postgres=# CREATE ROLE oozie LOGIN ENCRYPTED PASSWORD 'oozie'
NOSUPERUSER INHERIT CREATEDB NOCREATEROLE;
CREATE ROLE

postgres=# CREATE DATABASE "oozie" WITH OWNER = oozie
ENCODING = 'UTF8'
TABLESPACE = pg_default
LC_COLLATE = 'en_US.UTF-8'
LC_CTYPE = 'en_US.UTF-8'
CONNECTION LIMIT = -1;
CREATE DATABASE

postgres=# \q
```

3. Configure PostgreSQL to Accept Network Connections for the Oozie User.

- a) Edit the `postgresql.conf` file and set the `listen_addresses` property to `*`, to make sure that the PostgreSQL server starts listening on all your network interfaces. Also make sure that the `standard_conforming_strings` property is set to `off`.
- b) Edit the PostgreSQL `data/pg_hba.conf` file as follows:

```
host    oozie          oozie          0.0.0.0/0          md5
```

4. Reload the PostgreSQL Configuration.

```
sudo -u postgres pg_ctl reload -s -D /opt/PostgreSQL/8.4/data
```

Configuring MariaDB for Oozie

You must install MariaDB, create the Oozie database and MariaDB user, and add the MariaDB JDBC driver jar file to Oozie.

Procedure

1. Install and Start MariaDB.
2. Create the Oozie Database and Oozie MariaDB User.

For example, using the MariaDB `mysql` command-line tool:

```
$ mysql -u root -p
Enter password:

MariaDB [(none)]> create database oozie default character set utf8;
Query OK, 1 row affected (0.00 sec)
MariaDB [(none)]> grant all privileges on oozie.* to 'oozie'@'localhost'
identified by 'oozie';
Query OK, 0 rows affected (0.00 sec)

MariaDB [(none)]> grant all privileges on oozie.* to 'oozie'@'%' identi
fied by 'oozie';
Query OK, 0 rows affected (0.00 sec)

MariaDB [(none)]> exit
Bye
```

3. Add the MariaDB JDBC Driver JAR to Oozie.

Cloudera recommends that you use the MySQL JDBC driver for MariaDB. Copy or symbolically link the MySQL JDBC driver JAR to the `/var/lib/oozie/` directory.

Note: You must manually download the MySQL JDBC driver JAR file.

Configuring MySQL 5 for Oozie

You must install MySQL 5, create the Oozie database and MySQL user, and add the MySQL JDBC driver jar file to Oozie.

Procedure

1. Install and Start MySQL 5.

2. Create the Oozie Database and Oozie MySQL User.

For example, using the MySQL `mysql` command-line tool:

```
$ mysql -u root -p
Enter password:

mysql> create database oozie default character set utf8;
Query OK, 1 row affected (0.00 sec)

mysql> grant all privileges on oozie.* to 'oozie'@'localhost' identified
by 'oozie';
Query OK, 0 rows affected (0.00 sec)

mysql> grant all privileges on oozie.* to 'oozie'@'%' identified by 'oozi
e';
Query OK, 0 rows affected (0.00 sec)

mysql> exit
```

3. Add the MySQL JDBC Driver JAR to Oozie.

Copy or symbolically link the MySQL JDBC driver JAR into one of the following directories:

- For installations that use packages: `/var/lib/oozie/`
- For installations that use parcels: `/opt/cloudera/parcels/CDH/lib/oozie/lib/`

Note: You must manually download the MySQL JDBC driver JAR file.

Configuring MySQL 8 for Oozie

You must install MySQL 8, create the Oozie database and MySQL user, and add the MySQL JDBC driver jar file to Oozie.

Procedure

1. Install and Start MySQL 8.
2. Create the Oozie Database and Oozie MySQL User.

For example, using the MySQL `mysql` command-line tool:

```
$ mysql -u root -p
Enter password:
mysql> create database oozie default character set utf8;
Query OK, 1 row affected (0.00 sec)
mysql> CREATE USER 'oozie'@'localhost' IDENTIFIED BY 'oozie';
Query OK, 0 rows affected (0.00 sec)
mysql> GRANT ALL PRIVILEGES ON oozie.* TO 'oozie'@'localhost';
Query OK, 0 rows affected (0.00 sec)
mysql> CREATE USER 'oozie'@'%' IDENTIFIED BY 'oozie';
Query OK, 0 rows affected (0.01 sec)
mysql> GRANT ALL PRIVILEGES ON oozie.* TO 'oozie'@'%';
Query OK, 0 rows affected (0.00 sec)
mysql> exit
```

3. Add the MySQL JDBC Driver JAR to Oozie.

Copy or symbolically link the MySQL JDBC driver JAR into one of the following directories:

- For installations that use packages: `/var/lib/oozie/`
- For installations that use parcels: `/opt/cloudera/parcels/CDH/lib/oozie/lib/`

Note: You must manually download the MySQL JDBC driver JAR file.

Configuring Oracle for Oozie

You must install Oracle 12.2, create the Oozie Oracle user and grant privileges, and add the Oracle JDBC driver jar file to Oozie.

Procedure

1. Install and Start Oracle 12.2

Use [Oracle's instructions](#).

2. Create the Oozie Oracle User and Grant Privileges.

The following example uses the Oracle `sqlplus` command-line tool, and shows the privileges Cloudera recommends. Oozie needs `CREATE SESSION` to start and manage workflows. The additional roles are needed for creating and upgrading the Oozie database.

```
sqlplus system@localhost/<SERVICE_NAME>

SQL> create user <user> identified by <password> default tablespace <tablespace> temporary tablespace temp;
User created.
SQL> grant create sequence to <user>;
Grant succeeded.
SQL> grant create session to <user>;
Grant succeeded.
SQL> grant create table to <user>;
Grant succeeded.
SQL> alter user <user> quota unlimited on <tablespace>;
User altered.
SQL> exit
```

Important:

For security reasons, do not make the following grant:

```
grant select any table to oozie;
```

3. Add the Oracle JDBC Driver JAR to Oozie.

Copy or symbolically link the Oracle JDBC driver JAR into the `/var/lib/oozie/` directory.

Note: You must manually download the Oracle JDBC driver JAR file.

Working with the Oozie server

You can use the command-line interface to start or stop the Oozie server. In addition, you can access the Oozie server with the Oozie client or with a browser.

Starting the Oozie server

You can use the service oozie start command to start Oozie.

Before you begin

Ensure that you have performed *all* the required configuration steps.

Procedure

- Use the service oozie start command to start Oozie.

If you see the message Oozie System ID [oozie-oozie] started in the oozie.log log file, the system has started successfully.

Note: By default, Oozie server runs on port 11000 and its URL is `http://<OOZIE_HOSTNAME>:11000/oozie`. If SSL is enabled, then Oozie server runs on port 11443 by default.

Stopping the Oozie server

Use the `sudo service oozie stop` command to stop a running Oozie server.

Accessing the Oozie server with the Oozie Client

The Oozie client is a command-line utility that interacts with the Oozie server using the Oozie web-services API.

Procedure

- Use the `/usr/bin/oozie` script to run the Oozie client.

For example, if you want to invoke the client on the same machine where the Oozie server is running:

```
$ oozie admin -oozie https://<oozie_server>:11443/oozie -status
System mode: NORMAL
```

- To make it convenient to use this utility, set the environment variable `OOZIE_URL` to point to the URL of the Oozie server. Then you can skip the `-oozie` option.

For example, if you want to invoke the client on the same machine where the Oozie server is running, set the `OOZIE_URL` to `https://<oozie_server>:11443/oozie`.

```
$ export OOZIE_URL=https://<oozie_server>:11443/oozie
$ oozie admin -version
Oozie server build version: 4.0.0-cdh5.0.0
```

Important: If Oozie is configured with Kerberos Security enabled:

- You must have a Kerberos session running. For example, you can start a session by running the `kinit` command.
- Do not use `localhost`.

As with every service that uses Kerberos, Oozie has a Kerberos principal in the form `<SERVICE>/<HOSTNAME>@<REALM>`. In a Kerberos configuration, you must use the `<HOSTNAME>` value in the Kerberos principal to specify the Oozie server; for example, if the `<HOSTNAME>` in the principal is `myoozieserver.mydomain.com`, set `OOZIE_URL` as follows:

```
export OOZIE_URL=https://myoozieserver.mydomain.com:11443/oozie
```

If you use an alternate hostname or the IP address of the service, Oozie will not work properly.

- If you want to access Oozie client through Knox:

```
export OOZIE_URL=https://<knox_host>:<knox_port>/gateway/cdp-proxy-api/oozie
```

When you access Oozie client through Knox, you need to specify a username and password in the command line as Knox needs it:

```
export OOZIE_URL=https://<knox_host>:<knox_port>/gateway/cdp-proxy-api/oozie
oozie admin -version -auth BASIC -username <username> -password <password>
```

- When the Oozie server has SSL enabled, the Oozie client does not automatically set the necessary trust-store properties to form a connection. You can set these properties using the following methods:
 - Add them as system properties immediately after the oozie command. For instance:

```
oozie \
  "-Djavax.net.ssl.trustStore={trustStorePath}" \
  "-Djavax.net.ssl.trustStorePassword={trustStorePassword}" \
  "-Djavax.net.ssl.trustStoreType={trustStoreType}" \
  {oozieCommand} \
  -oozie "{oozieUrl}" \
  ...
```

- You can also set these properties by defining the OOZIE_CLIENT_OPTS environment variable before running the Oozie command. For instance:

```
export OOZIE_CLIENT_OPTS="-Djavax.net.ssl.trustStore={trustStorePath} -Djavax.net.ssl.trustStorePassword={trustStorePassword} -Djavax.net.ssl.trustStoreType={trustStoreType}"
```

- If you prefer, you can also utilize the `-insecure` argument with the Oozie command line to prevent the client from validating the certificates:

```
oozie \
  {oozieCommand} \
  -oozie "{oozieUrl}" \
  -insecure \
  ...
```

Accessing the Oozie server with a browser

If you have enabled the Oozie web console by adding the ExtJS library, you can connect to the console at `http://<OOZIE_HOSTNAME>:11000/oozie`.

Note: If the Oozie server is configured to use Kerberos HTTP SPNEGO Authentication, you must use a web browser that supports Kerberos HTTP SPNEGO (for example, Firefox or Internet Explorer).

For information on how to enable the Oozie web console on managed clusters by adding the ExtJS library, see *Enabling the Oozie web console on managed clusters*.

Related Information

[Enabling the Oozie web console on managed clusters](#)

Adding schema to Oozie using Cloudera Manager

Cloudera Manager automatically configures Oozie with all available official schemas, and corresponding tables. You can manually add a schema (official or custom) with Cloudera Manager.

Procedure

1. In the Cloudera Manager Admin Console, go to the Oozie service.
2. Click the Configuration tab.
3. Select Scope Oozie Server .
4. Select Category Advanced .
5. Locate the Oozie SchemaService Workflow Extension Schemas property or search for it by typing its name in the Search box.
6. Enter the desired schema from the following schema list appending .xsd to each entry.
To apply this configuration property to other role groups as needed, edit the value for the appropriate role group.
7. Enter a Reason for change, and then click Save Change to commit the changes.
8. Restart the Oozie service.

Table 2: Oozie schema

Schema	CDP
distcp	distcp-action-0.1 distcp-action-0.2 distcp-action-1.0
email	email-action-0.1 email-action-0.2
git	git-action-1.0

Enabling the Oozie web console on managed clusters

You must extract the ext-2.2 libraries to your Oozie server host and enable the Oozie web console.

Procedure

1. Download [ext-2.2](#).
2. Extract the contents of the file to /var/lib/oozie on the same host as the Oozie Server.
After extraction, the content of the directories is as follows:

```
ls -ltr /var/lib/oozie/
```

```
total 984
drwxr-xr-x 9 oozie oozie 4096 Aug 4 2008 ext-2.2
-rw-r--r-- 1 systest root 999635 Jan 23 23:24 mysql-connector-java.jar
```

```
ls -ltr /var/lib/oozie/ext-2.2/
```

```
total 1752
```

```

-rw-r--r-- 1 oozie oozie 893 Feb 24 2008 INCLUDE_ORDER.txt

drwxr-xr-x 5 oozie oozie 94 Jan 24 15:49 air

```

For example:

```

unzip ext-2.2.zip -d /var/lib/oozie
chown -R oozie:oozie /var/lib/oozie/ext-2.2

```

3. In Cloudera Manager Admin Console, go to the Oozie service.
4. Restart the Oozie service.

Enabling Oozie SLA with Cloudera Manager

You can use Oozie to define SLA limits for critical applications and actively monitor these jobs.

Procedure

1. In the Cloudera Manager Admin Console, go to the Oozie service.
2. Click the Configuration tab.
3. Locate the Enable SLA Integration property or search for it by typing its name in the Search box.
4. Select Enable SLA Integration. This sets the required values for `oozie.services.ext` and `oozie.service.EventHandlerService.event.listeners` in `oozie-site.xml`.
5. Enter a Reason for change, and then click Save Changes to commit the changes.
6. Restart the Oozie service.

What to do next

The following properties are set by default when you enable Oozie SLA in Cloudera Manager. You do not have to explicitly define them, unless you want to modify any of these parameters:

```

oozie.service.SchemaService.wf.schemas
oozie.service.SchemaService.coord.schemas
oozie.service.SchemaService.sla.schemas
oozie.service.ELService.groups
oozie.service.ELService.constants.wf-sla-submit
oozie.service.ELService.ext.constants.coord-sla-create
oozie.service.ELService.functions.coord-sla-create
oozie.service.ELService.constants.coord-sla-submit
oozie.service.ELService.functions.coord-sla-submit
oozie.service.EventHandlerService.filter.app.types
oozie.service.EventHandlerService.event.queue
oozie.service.EventHandlerService.queue.size
oozie.service.EventHandlerService.worker.interval
oozie.service.EventHandlerService.batch.size
oozie.service.EventHandlerService.worker.threads

```

```
oozie.sla.service.SLAService.alert.events
oozie.sla.service.SLAService.capacity
oozie.sla.service.SLAService.calculator.impl
oozie.sla.service.SLAService.job.event.latency
oozie.sla.service.SLAService.check.interval
```

For `oozie.sla.service.SLAService.alert.events`, only `END_MISS` is configured by default. To change the alert events, explicitly set `END_MISS`, `START_MISS`, or `DURATION_MISS`, in Oozie Server Advanced Configuration Snippet (Safety Valve) for `oozie-site.xml`.

Oozie database configurations

You can use Cloudera Manager to configure data purge settings, loading, and dumping the Oozie database. Depending on the database that you are using with Oozie, you can set the timezone for the database.

Related Information

[Configuring an external database for Oozie](#)

Configuring Oozie data purge settings using Cloudera Manager

You can change your Oozie configuration to control when data is purged to improve performance, reduce database disk usage, or keep the history for a longer period of time. Limiting the size of the Oozie database can also improve performance during upgrades.

About this task

All Oozie workflows older than 30 days are purged from the database by default. However, actions associated with long-running coordinators do not purge until the coordinators complete. If, for example, you schedule a coordinator to run for a year, all those actions remain in the database for the year.

Procedure

1. In the Cloudera Manager Admin Console, go to the Oozie service.
2. Click the Configuration tab.
3. Type `purge` in the Search box.
4. Set the following properties as required for your environment:
 - **Enable Purge for Long-Running Coordinator Jobs**
Select this property to enable purging of long-running coordinator jobs for which the workflow jobs are older than the value you set for the `Days to Keep Completed Workflow Jobs` property.
 - `Days to Keep Completed Workflow Jobs`
 - `Days to Keep Completed Coordinator Jobs`
 - `Days to Keep Completed Bundle Jobs`
5. Enter a Reason for change, and then click `Save Changes` to commit the changes.
6. Select `Actions Restart` to restart the Oozie Service.

Loading the Oozie database

You must configure the database in which to load your Oozie data, create the required database tables, and then load the Oozie database.

Procedure

1. Stop the Oozie server (in HA mode, stop all Oozie servers).

2. Install and configure the empty database in which to load your Oozie data.
The db.version of the database must match the db.version of the dump file.
3. Select **Actions Create Oozie Database Tables** .
Confirm you want to create the database tables by clicking **Create Oozie Database Tables**.
4. Verify *Database Dump File* is set correctly.
 - a) In the Cloudera Manager Admin Console, click the Oozie service.
 - b) Go to the Configuration page.
 - c) Select **Scope Oozie Server** .
 - d) Select **Category Database** .
5. Select **Actions Load Database** .
Confirm you want to dump the database to the specified location by clicking **Load Database**.
6. Select **Actions Start** .
Confirm you want to start the service by clicking **Start**.

Dumping the Oozie database

You must stop the Oozie server, specify the location to which you want to dump the Oozie database, and then perform the dumping operation.

Procedure

1. Stop the Oozie server (in HA mode, stop all Oozie servers).
2. In the Cloudera Manager Admin Console, go to the Oozie service status page.
3. Select **Actions Stop** .
Confirm you want to stop the service by clicking **Stop**.
4. Specify *Database Dump File*.
 - a) Go to the Configuration page.
 - b) Select **Scope Oozie Server** .
 - c) Select **Category Database** .
 - d) Set a file location for the Database Dump File.
5. Select **Actions Dump Database** .
Confirm that you want to dump the database to the specified location by clicking **Dump Database**.
During the export process, Cloudera Manager fetches and writes the database content a compressed zip specified by the *Database Dump File* property.

Setting the Oozie database timezone

Depending on the type of database you are using with Oozie, you must configure specific properties for setting the database timezone.

Cloudera recommends that you set the timezone in the Oozie database to GMT. Databases do not handle Daylight Saving Time (DST) shifts correctly. There might be problems if you run any Coordinators with actions scheduled to materialize during the one-hour period that gets lost in DST.

Important: Changing the timezone on an existing Oozie database while Coordinators are already running might cause Coordinators to shift by the offset of their timezone from GMT one time after you make this change.

For more information about how to set your database's timezone, see your database's documentation.

Prerequisites for configuring TLS/SSL for Oozie

There are certain prerequisites that must be fulfilled for configuring TLS/SSL for Oozie.

- Keystores for Oozie must be readable by the oozie user. This can be a copy of the Hadoop services' keystore with permissions set to 0440 and owned by the oozie group.
- Truststores must have permissions set to 0444, which means that all users can read them.
- Specify absolute paths to the keystore and truststore files. These settings apply to all hosts on which daemon roles of the Oozie service run so the paths you choose must be valid on all hosts.
- If there is a DataNode and an Oozie server running on the same host, they can use the same certificate.

Configure TLS/SSL for Oozie

You can edit properties to enable TLS/SSL for Oozie, specify the keystore file location on the local file system, and set the password for the keystore.

Procedure

1. Open the Cloudera Manager Admin Console and go to the Oozie service.
2. Click the Configuration tab.
3. In the Search field, type TLS/SSL to show the Oozie TLS/SSL properties.
4. Edit the following TLS/SSL properties according to your cluster configuration.

Property	Description
Enable TLS/SSL for Oozie	Check this field to enable TLS/SSL for Oozie.
Oozie TLS/SSL Server JKS Keystore File Location	Location of the keystore file on the local file system.
Oozie TLS/SSL Server JKS Keystore File Password	Password for the keystore.

5. Click Save Changes.
6. Restart the Oozie service.

Related Information

[Oozie security enhancements](#)

Oozie security enhancements

Learn about Oozie security enhancements related to callback, callback endpoint, FIPS compliance, and SMTP (Simple Mail Transfer Protocol). Oozie will be notified about completion of tasks through HTTPS.

Callback

- Prior to this enhancement, even though SSL was enabled for Oozie, the callback mechanism – which notifies the Oozie server after an action finished (success/failed) – was going through HTTP. With the enhanced callback feature if TLS/SSL is enabled for Oozie, the callback invocation goes through HTTPS. This applies to all Oozie actions, including map-reduce actions. For map-reduce actions, as always, the Oozie Application Master (AM) container does not wait for the map-reduce Job to complete, but YARN makes a callback to Oozie when the map-reduce Job completes. This callback goes through HTTPS as well when TLS/SSL is enabled for Oozie. When TLS/SSL is enabled for Oozie, Oozie listens only on the HTTPS port and not on the HTTP port as the HTTP port

was only needed for the callback mechanism. Oozie will not explicitly upload the truststore file required for the HTTPS connection to the YARN applications launched by Oozie and neither should you, but Oozie will pass the location of the file used by Oozie itself to the callback mechanism running inside the YARN container. Hence, the truststore file used by Oozie needs to be available on all NodeManager Hosts and accessible by YARN containers.

Note: Until now, the default callback command for SSH actions was `curl`. If you have enabled TLS/SSL for Oozie, Cloudera Manager will change this to `curl -k`. If you have added a custom callback command setup for SSH actions through a safety valve, that setup will not be overridden by Cloudera Manager. You must make sure that your command supports TLS/SSL.

Callback Endpoint

- Along with the callback mechanism, you can also enable authentication for the callback endpoint. If you have Kerberos configured on your cluster, authentication is enabled for all endpoints of Oozie by default except for the callback endpoint. You can enable authentication for the callback endpoint by setting the `oozie.servlet.CallbackServlet.authentication.required` property to `true` as a safety-valve in Cloudera Manager.

Note: After the release of Cloudera Manager 7.3.0, you do not need to configure the callback endpoint authentication through a safety-valve because Cloudera is introducing the Oozie Callback Servlet Authentication property. After the release of Cloudera Manager 7.3.0, upgrade Cloudera Manager, and search and select the new Oozie Callback Servlet Authentication option. If you have set the above property using safety-valve, you can remove it and instead enable it through the new checkbox. No new configuration is required in Cloudera Runtime. When callback authentication is enabled, Oozie does not allow an unauthenticated invocation to the endpoint. Before starting the AM container, Oozie generates a new type of delegation token and when the Job finishes and the AM container notifies the Oozie server. This new Oozie delegation token is used to make the callback.

Note: If you enable authentication on the callback endpoint, when you are executing an SSH action, make sure your SSH command will create a Kerberized environment. Otherwise, the callback will fail.

FIPS Compliance

To make Oozie FIPS compliant, the following changes are introduced:

- When TLS/SSL is enabled for Oozie, apart from setting the `trustStore`, `trustStorePassword`, `keyStore`, and `keyStorePassword` properties, Cloudera Manager adds two new properties `oozie.https.truststore.type` and `oozie.https.keystore.type` in the `oozie-site.xml` file. These properties will contain the value of the globally configured `keyStore` type in Cloudera Manager.
- When TLS/SSL is enabled for ZooKeeper and Oozie runs with High-Availability, Cloudera Manager sets the `oozie.zookeeper.https.truststore.type` and `oozie.zookeeper.https.keystore.type` properties along with the existing `oozie.zookeeper.https.truststore/file/password` property in the `oozie-site.xml` file.

SMTP

To configure custom TLS/SSL protocols when executing an email action, add the new `oozie.email.smtp.ssl.protocols` property using a safety valve in Cloudera Manager.

Additional considerations when configuring TLS/SSL for Oozie HA

To enable clients to connect to Oozie servers (the target servers) through the load balancer using TLS/SSL, configure the load balancer for TLS/SSL pass-through.

This means that the load balancer does not perform encryption or decryption but instead passes traffic from clients and servers to the appropriate target host. See the documentation for your load balancer for details.

Configure Oozie client when TLS/SSL is enabled

You must configure the Oozie client if TLS/SSL is enabled in your cluster. You can configure the Oozie command line client using either the JDK certificate store or using the trust-store file.

Procedure

Using JDK Certificate Store

- Import the certificate into the JDK certificate store. For example,

```
keytool -keystore </usr/java/default/lib/security/cacerts> -import -trustcacerts -alias autotls -file </opt/cloudera/CMCA/trust-store/cm-auto-global_cacerts.pem> --storepass changeit -noprompt
```

You must specify the JDK/JRE certificate file location with the `-keystore` parameter and the certificate you want to import with the `-file` parameter.

Using Trust Store

- Manually specify the trust-store and trust-store password for the Oozie command line client. For example,

```
oozie -Djavax.net.ssl.trustStore={trustStoreFile} -Djavax.net.ssl.trustStorePassword={trustStorePassword} jobs -oozie https://{oozieHost}:{ooziePort}/oozie
```
