User management in Hue

Hue is a gateway to CDP cluster services and both have completely separate permissions. Being a Hue superuser does not grant access to HDFS, Hive, and so on.

Users who log on to the Hue UI must have permission to use Hue and to each CDP service accessible within Hue.

A common configuration is for “Hue users” to be authenticated with an LDAP server and “CDP users” with Kerberos. These users can differ. For example, CDP services do not authenticate each user who logs on to Hue. Rather, they authenticate “Hue” and trust that Hue has authenticated “its” users.

Once Hue is authenticated by a service such as Hive, Hue impersonates the user requesting use of that service. For example, to create a Hive table. The service uses Apache Ranger to ensure the group to which that user belongs is authorized for that action.

Hue user permissions are at the application level only. For example, a Hue superuser can filter Hue user access to a CDP service but cannot authorize the use of its features. Again, Ranger does that.

Understanding Hue users and groups

There are two types of users in Hue - superusers and general users referred to as users, each with specific privileges. These users can be a part of certain groups. Groups enable you to control which Hue applications and features your users can view and access when they log into Hue.

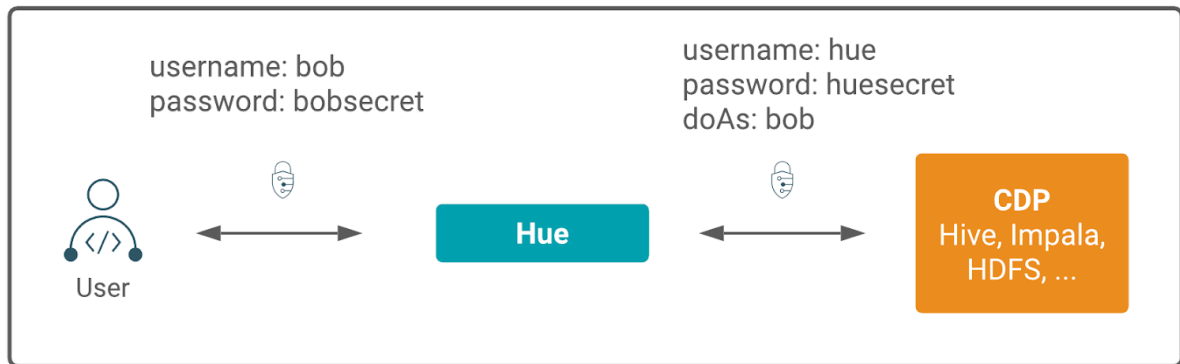

On a non-secure CDP cluster, the first user logging into Hue after the initial installation becomes the first superuser. Superusers have the permissions to perform the following administrative functions:

- Add and delete users
- Add and delete groups
- Assign permissions to groups
- Change a user into a superuser
- Import users and groups from an LDAP server

If a user is part of the superuser LDAP group in Hue, then that user is also a part of the group of superusers in Hue.

Users can only change their name, e-mail address, and password. They can log in to Hue and run Hue applications, subject to the permissions provided by the Hue groups to which they belong. This is different from how CDP perceives the Hue application when you submit a Hive or an Impala query from the Hue user interface (UI). Hue is a server between the users and the CDP services. Hue is considered as a single ‘hue’ user by the other services in the CDP cluster.

For example, when a user ‘bob’ submits a query from Hue, Hue also sends the username of this user to the corresponding service in CDP. The HIVE_ON_TEZ service in CDP considers ‘bob’ as the owner of the query and not ‘hue’. This is illustrated in the following graphic:

Hue is a gateway to CDP cluster services and both have separate permissions. A Hue superuser is not granted access to HDFS, Hive, and other CDP cluster services. Apache Ranger governs access to the CDP cluster services.

Note: Groups in Hue are different from groups in Ranger.

Hue user permissions are at the application level only. For example, a Hue superuser can filter Hue user access to a CDP service but cannot authorize the use of its features. Users who log on to the Hue UI must have permission to use Hue and to each CDP service accessible within Hue.

Finding the list of Hue superusers

You can fetch the list of superusers by using the Hue shell with Python code or by running a SQL query on the `auth_user` table.

Using the Hue shell and Python code to find Hue superusers

1. Connecting to Hue shell by running the following command:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/hue shell --cm-managed
```

2. Enter the Python code as follows:

```
from django.contrib.auth.models import User
print "%s" % User.objects.filter(is_superuser = True)
```

Sample output:

```
<QuerySet [<User: admin>]>
```

Running a SQL query on the `auth_user` table to find Hue superusers

1. Connect to Hue database shell by running the following command:

```
/opt/cloudera/parcels/CDH/lib/hue/build/env/bin/hue dbshell --cm-managed
```

2. Run the following SQL query:

```
select username, is_superuser from auth_user where is_superuser=1;
```

Sample output:

```
-----+
username is_superuser
-----+

admin 1
-----+
1 row in set (0.00 sec)
```

Creating a Hue user

You can create new Hue users and superusers from the Hue web UI and assign them to groups so that they can view and access Hue as per the permissions granted to them.

About this task

Note: You can create a username for Hue 150 characters long.

Before you begin

Per user home directories are created on HDFS when you create a new user in Hue, which the user can use to store and retrieve files using the Hue File Browser. To prevent unauthorized access by other Hue users, add the following lines in Cloudera Manager Clusters Hue Configuration Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini :

```
[useradmin]
home_dir_permissions=0700
use_home_dir_permissions=true
```

Set use_home_dir_permissions to false to use the HDFS umask.

Procedure

1. Sign in to the Hue UI as a superuser.

- From the left assist panel, point your cursor to the user profile icon and click Manage Users.

The **User Admin** page is displayed.

- On the **User Admin** page, click Add User.

The **Create user** page is displayed.

- Enter the username and password for the user that you are adding on the Credentials tab.

To create a separate Hue home directory for the user, select the Create home directory option.

Click Next.

- On the Profile and Group tab, create a profile for the user by entering the details such as name and email address.

At this point, if you have already created a group(s) that you want to assign to the user, then select it from the list displayed in the Groups field.

A user can be a part of more than one group.

Click Next.

- (Optional) On the Advanced tab, select the Superuser status option to make this user a superuser and click Add user.

The new user is displayed on the **Users** page.

[Configuring file and directory permissions for Hue](#)

Controlling user access to Hue

Administrators can control users who can access Hue by creating different LDAP login groups, adding users needing access to these login groups, and then specifying the login groups in the Advanced Configuration Snippet in Cloudera Manager.

Before you begin

Ensure that you have added users needing access to Hue to a login group.

Procedure

- Log in to Cloudera Manager as an Administrator.

- Go to Clusters Hue service Configuration and enter the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[desktop]
[[ldap]]
login_groups=[***LDAP-GRP1***], [***LDAP-GRP2***], [***LDAP-GRP3***]
```

Where, [***LDAP-GRP1***], [***LDAP-GRP2***], [***LDAP-GRP3***] are the login groups containing users needing access to Hue.

- Click Save Changes.
- Restart the Hue service.

Options for importing and syncing LDAP users and groups in Hue

Configuring Hue for Lightweight Directory Access Protocol (LDAP) enables you to import users and groups from a directory service, synchronize group membership manually or automatically at login, and authenticate users with LDAP.

There are four options to import and sync LDAP users and groups in Hue:

LDAP sync option	Description
Add/Sync LDAP user	Import and synchronize one user at a time
Sync LDAP users/groups	Synchronize user memberships in all groups
Add/Sync LDAP group	Import and synchronize all users in one group
sync_groups_on_login	Automatically synchronize group membership at login

The following flowchart shows the process and the options to import and synchronize new users or groups in Hue:

Importing a group from LDAP creates a group in Hue. When you synchronize a group, Hue checks the user's group membership in LDAP and synchronizes it to the corresponding group in Hue. To synchronize an LDAP group with Hue, the group must be imported in the Hue database.

For example, if a user belongs to 10 LDAP groups, but only 5 groups are present in Hue, then only these 5 groups are synced when new users are added to these groups. This mechanism helps to avoid including irrelevant group data in the Hue database.

If you have multiple LDAP groups that are synchronized with Hue, then you can automate the synchronization process by turning on the sync_groups_on_login option in the Hue Advanced Configuration Snippet. However, this process can be burdensome if you have a large number of users logging in and authenticating simultaneously or new users getting added to the LDAP group, as multiple synchronization requests are triggered which could cause collisions on database writes. An alternative approach is to synchronize users using the command line option, which

you can script and automate as a cron job. To manually synchronize LDAP groups having the newly added users that need to be added to Hue, run the following command separately for each LDAP group:

```
$HUE_HOME/build/env/bin/hue import_ldap_group --import-members [***LDAP-GROUP-NAME***] --cm-managed
```

Importing and synchronizing users and groups with an LDAP server in Hue

You can import and synchronize one user at a time, synchronize all user memberships in all groups, import and synchronize all users in one group, or enable synchronization of group memberships automatically when users in those groups log in to Hue.

Before you begin

To synchronize your Hue users and groups with your LDAP server:

- Hue must be configured to authenticate with LDAP.
- The logged in user must have Hue superuser permissions.

Note: If the backend is Isilon, then pre-create the users home folder /user/[***USERNAME***] and assign the necessary permissions to the folder owner/group. Failing to do this, causes the LDAP sync to fail because Hue assigns the home folder's group permissions to be the username, but Isilon does not have a group with the username existing (unless it was pre-created.)

About this task

Important: Hue does not support importing all groups at once.

Procedure

1. Log in to Hue as a superuser.
2. Go to User Admin Users .
The **User Admin** page is displayed.
3. To import and synchronize one LDAP user in Hue:
 - a) Click Add/Sync LDAP user.
 - b) Add a username, check Create home directory, and click Add/Sync user.
4. To synchronize group memberships for LDAP users who have already been imported to Hue:
 - a) Click Sync LDAP users/groups.
 - b) Select the Create home directories option and click Sync.

Note: This synchronizes group memberships with the LDAP server.

5. To import and synchronize one LDAP group containing its users:
 - a) Click Add/Sync LDAP group.
 - b) Check Create home directories, and click Sync.
6. To configure Hue to automatically synchronize LDAP groups and their users when they log in to Hue:
 - a) Log in to Cloudera Manager as an Administrator.
 - b) Go to Clusters Hue service Configuration and enter the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[desktop]
[[ldap]]
sync_groups_on_login=true
```

- c) Click Save Changes.

d) Restart the Hue service.

Note: LDAP `sync_groups_on_login` only works with search bind authentication. This process can be burdensome if you have a large number of users logging in and authenticating simultaneously or new users getting added to the LDAP group, as multiple synchronization requests are triggered which could cause collisions on database writes.

- To synchronize LDAP groups having the newly added users that need to be added to Hue, run the following command separately for each LDAP group:

```
$HUE_HOME/build/env/bin/hue import_ldap_group --import-members [***LDAP-GROUP-NAME***] --cm-managed
```

You can script and automate this process using a cron job.

Locking an account after invalid login attempts

As a security measure, you can configure Hue to lock an account after a set number of unsuccessful or invalid login attempts by specifying the number of attempts in the `login_failure_limit` parameter and setting the `login_lock_out_at_failure` parameter to true in the Hue Advanced Configuration Snippet in Cloudera Manager.

Procedure

- Log in to Cloudera Manager as an Administrator.
- Go to `Clusters Hue Configuration` and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field:

```
[desktop]
[[auth]]
login_failure_limit=[***NUMBER-OF-ATTEMPTS-BEFORE-ACCOUNT-LOCKOUT***]
login_lock_out_at_failure=true
```

Replace `[***NUMBER-OF-ATTEMPTS-BEFORE-ACCOUNT-LOCKOUT***]` with the number of unsuccessful login attempts after which you want to lock an account. For example, if you set `login_failure_limit` to 3, then the user will be locked out on the third invalid attempt.

- Click `Save Changes`.
- Restart the Hue service to apply stale configurations.

You can use the Rolling Restart option to minimize downtime.

Results

A user's account will be locked out after crossing the set number of invalid login attempts and the following message is displayed "Account locked: too many login attempts. Contact an admin to unlock your account."

Unlocking locked out user accounts in Hue

If Hue is configured to lock out a user account after a set number of invalid login attempts, then the users get an "Account locked: too many login attempts. Contact an admin to unlock your account." error message. As an Admin, you can unlock user accounts from the Hue web interface.

Procedure

- Log in to the Hue web interface as an Administrator or a Hue superuser.
- Expand your user name on the left assist panel and click `Administer Users`.
The **User Admin** page is displayed.
- Click on the username that you want to unlock.

4. Go to the **Step 3. Advanced** tab and select the Unlock Account option.
5. Click Update User.

Results

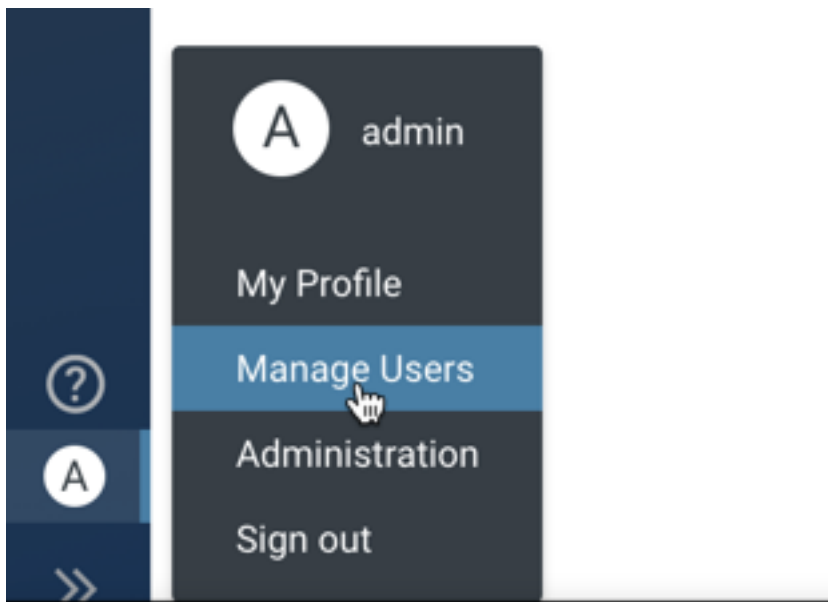

The user should be able to log in to Hue.

Creating a group in Hue

By creating groups, you can club certain permissions that you want to assign to specific users in your organization.

Procedure

1. Sign in to the Hue UI as a superuser.
2. From the left assist panel, point your cursor to the user profile icon and click Manage Users.

The **User Admin** page is displayed.

3. Go to the Groups tab.
4. Click Add group.
5. On the **Create group** page, specify a name for your group.
6. (Optional) You can select the users that you want to add to this group.
7. Select the permissions that you want to associate with the group and click Add group.

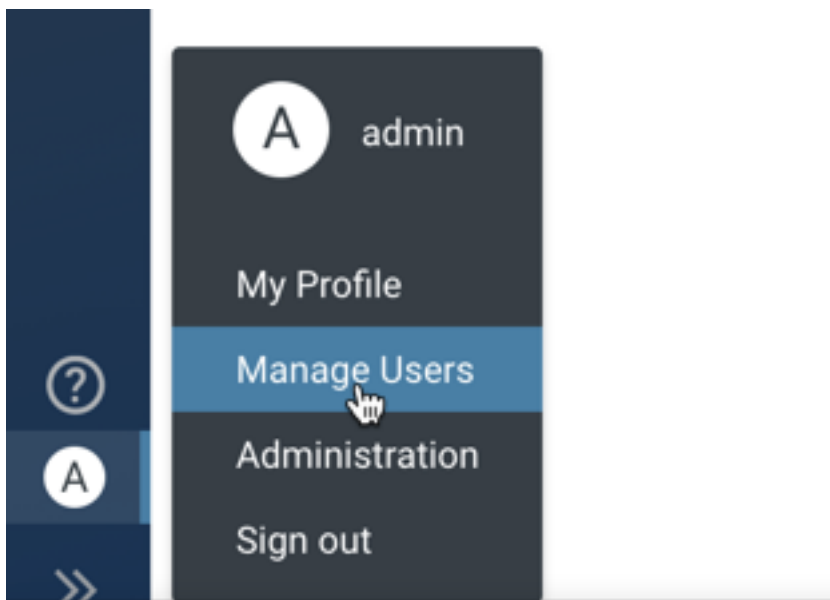

The newly added group is displayed on the **Groups** page along with the list of members and permissions associated with it.

Managing Hue permissions

Permissions for Hue applications are granted to groups, with users gaining permissions based on their group membership. Group permissions define the Hue applications visible to group members when they log in to Hue and the application features available to them. There is a fixed set of Hue permissions. You cannot add or modify permissions. However, you can apply permission to group(s).

Procedure

1. Sign in to the Hue UI as a superuser.
2. From the left assist panel, point your cursor to the user profile icon and click Manage Users.

The **User Admin** page is displayed.

3. From the **User Admin** page, go to the Permissions tab.
The **Permissions** page displays the list of all the available permissions.
4. Click a permission that you want to assign to a group(s).
The **Edit [permission name]** page is displayed.
5. Select the group(s) on which you want to apply the permission and click Update permission.
The “Permission information updated successfully” message is displayed.

Resetting Hue user password

The first user logging into Hue after its initial installation becomes the first superuser. Even if a user does not log into the Hue UI, the first security scan may log in creating an initial user and therefore resulting in an unknown username and password. You can change the password for a user if you know the username or you can create a new superuser user and then use it to log in to Hue and change the password for a user.

Procedure

1. Sign in to the Hue server as the root user and go to the Hue home directory.
2. If you know the user ID of the currently logged in user, then reset the password by running the following command:

```
build/env/bin/hue changepassword [***USER-ID***] --cm-managed
```

Replace the *USER-ID* with the actual ID of the user.

3. If you do not know the user ID of the user whose password you want to change, then create a new Hue admin user by running the following command:

```
build/env/bin/hue createsuperuser --cm-managed
```

After creating a new admin user, log in to Hue and reset the password for a given user ID.

Assigning superuser status to an LDAP user

The Hue User Admin application provides two levels of privileges: users and superusers. The superusers have administrative privileges.

About this task

Users can change their name, email address, and password. They can log in to Hue and run Hue applications according to their group permissions.

Superusers can perform administrative functions such as:

- Add and delete users and groups
- Import and sync users and groups from an LDAP server
- Assign group permissions
- Promote users to superusers and vice versa.

Hue superusers have no special privileges to the underlying CDP cluster services. Ranger is used to add those privileges.

Important: On a non-secure cluster, the first user to log in to Hue without LDAP authentication becomes the first superuser.

Procedure

In a secure cluster with LDAP deployed, there are three ways to assign superuser status to a user:

- With `desktop.auth.backend.AllowAllBackend` set for the Authentication Backend property in Cloudera Manager temporarily enabled, assign superuser status and synchronize one user to the LDAP server.
- With `desktop.auth.backend.LdapBackend` set for the Authentication Backend property in Cloudera Manager, run a Hue shell command to apply superuser status.
- Enable multiple backends so that the first user to log on still works when integrated with LDAP.

Configuring file and directory permissions for Hue

Per user home directories are created on HDFS when you create a new user in Hue, which the user can use to store and retrieve files using the Hue File Browser. You must either configure Hue to use the same permissions of the HDFS umask or use different permissions when a user creates files and directories from the Hue File Browser. It is recommended to define the home directory permissions before creating users in Hue.

About this task

When you set up CDP, you may have set a umask for all files and directories that would be created on HDFS using the “`fs.permissions.umask-mode`” parameter. The default HDFS umask is 0022. At this point, you can allow Hue to use the permissions as defined by HDFS umask or you can configure Hue to use a different set of permissions. This is controlled by the following two parameters in Hue: “`home_dir_permissions`” and “`use_home_dir_permissions`”. The “`use_home_dir_permissions`” parameter is set to true by default.

To allow Hue to create files and directories with permissions different than the HDFS umask, set the following in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field in Cloudera Manager:

```
[useradmin]
home_dir_permissions=[ ***HUE-FILE-DIR-PERMISSIONS*** ]
use_home_dir_permissions=true
```

For example:

```
[useradmin]
home_dir_permissions=0700
use_home_dir_permissions=true
```

To allow Hue to use the same file and directory permissions as the HDFS umask, set the following in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field in Cloudera Manager:

```
[useradmin]
use_home_dir_permissions=false
```

If you have not defined the home directory permissions in Hue by setting the value of the `home_dir_permissions` property in the Hue Advanced Configuration before creating users in Hue, then you can change the permissions for those users later to prevent unauthorized access.

Procedure

1. SSH in to the Hue server host as an Administrator.
2. Run the following command to change the permission for a user:

```
hdfs dfs -chmod 700 /user/[***USERNAME***]
```

User authentication in Hue

CDP services do not authenticate each user that logs in to Hue. The CDP services authenticate Hue and trust that Hue has authenticated its users. In a most typical configuration, Hue users can be authenticated with an LDAP server and the CDP users can be authenticated with Kerberos. You can also use SAML for Single Sign-on (SSO) authentication.

After Hue is authenticated by a service such as Hive, Hue impersonates the user requesting the use of that service, for example, to create a Hive table. In this case, the Hive service uses Apache Ranger to ensure that the group to which the user belonged is authorized for that action (to create a Hive table).

Note: By default, the Hue session uses a secure cookie protocol.

Authenticating Hue users with Kerberos

For Hue to work properly with a CDP cluster that uses Kerberos for authentication, the Kerberos Ticket Renewer role must be added to the Hue service.

About this task

Use the Cloudera Manager Admin Console to add the Kerberos Ticket Renewer role to each host with a Hue Server role instance. The Hue Kerberos Ticket Renewer renews only those tickets created for the Hue service principal: `hue/hostname@REALM-NAME`. The Hue principal impersonates other users for applications within Hue such as the Job Browser, File Browser, and so on. Other services, such as HDFS and MapReduce, do not use the Hue Kerberos Ticket Renewer. Instead these other services handle ticket renewal as needed by using their own mechanisms.

Procedure

1. On the Cloudera Manager home page, select the Hue service.
2. On the Hue service page, click the Instances tab.

- On the Instances page, click Add Role Instances on the right side of the page. This launches the Add Role Instances wizard.
- To add a Kerberos Ticket Renewer role instance to the same host that has the Hue server on your CDP cluster, click Select hosts under Kerberos Ticket Renewer:

To check which host has the Hue Server role instance, click View By Host, which launches a table that lists all the hosts in your CDP cluster and shows all the roles each host already has.

- In the host selection dialog box, after selecting the host where you want to add the Kerberos Ticket Renewer role instance, click OK, and Cloudera Manager adds the role instance.
- After processing the request to add the role instance, Cloudera Manager returns you to the Instances page and prompts you to restart the service. Click the Restart the service (or the instance)... link so the configuration change can take effect.
- After the services have restarted, click Finish to return to the Instances page.

Repeat these steps for each Hue Server role on your cluster.

What to do next

Troubleshooting the Kerberos Ticket Renewer:

If the Hue Kerberos Ticket Renewer does not start, check the configuration of your Kerberos Key Distribution Center (KDC). Look at the ticket renewal property, `maxrenewlife`, to ensure that the principals, `hue/<host_name>` and `krbtgt`, are renewable. If these principals are not renewable, run the following commands on the KDC to enable them:

```
kadmin.local: modprinc -maxrenewlife 90day krbtgt/<YOUR_REALM.COM>
kadmin.local: modprinc -maxrenewlife 90day +allow_renewable hue/
<host_name>@<YOUR_REALM>
```

Authenticating Hue users with LDAP

Configuring Hue for Lightweight Directory Access Protocol (LDAP) enables you to import users and groups from a directory service, synchronize group membership manually or automatically at login, and authenticate with an LDAP server.

Hue supports Microsoft Active Directory (AD) and open standard LDAP such as OpenLDAP and Forgerock OpenDJ Directory Services.

Integrating Hue with LDAP

When Hue is integrated with LDAP, users can use their existing credentials to authenticate and inherit their existing groups transparently. There is no need to save or duplicate any employee password in Hue.

When authenticating using LDAP, Hue validates login credentials against an LDAP directory service if Hue is configured with the LDAP authentication backend (`desktop.auth.backend.LdapBackend`) in Cloudera Manager.

The LDAP authentication backend automatically creates users that do not exist in Hue by default. Hue needs to import users to properly perform the authentication. Passwords are never imported when importing users. You can disable automatic import of users by setting the `create_users_on_login` property in the Cloudera Manager Clusters Hue service Configuration Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field to `false`.

```
[desktop]
[[ldap]]
create_users_on_login=false
```

The purpose of disabling the automatic import is to allow only a predefined list of manually imported users to login.

Preserving the case of the usernames

If you are using mixed case, upper case, or Camel case for usernames in your LDAP directory, then you must add the following configurations in Hue's Advanced Configuration Snippet (Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini`), so that the user names are not over written in lower case in the Hue's database. Set the values of these properties to `true` or `false` depending on your requirement:

```
[desktop]
[[auth]]
ignore_username_case=true
force_username_uppercase=true/false
force_username_lowercase=true/false
[[ldap]]
ignore_username_case=true
force_username_uppercase=true/false
force_username_lowercase=true/false
```

Binding Hue with LDAP

There are two ways to bind Hue with an LDAP directory service:

Search Bind

The search bind mechanism for authenticating will perform an `ldapsearch` against the directory service and bind using the found distinguished name (DN) and password provided. This is the default method of authentication used by Hue with LDAP.

You can restrict the search process by configuring the following two properties under the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` `[desktop] > [[ldap]] > [[[users]]]` section.

Property	Description
<code>user_filter</code>	General LDAP filter to restrict the search. Default: <code>"objectclass=*"</code>
<code>user_name_attr</code>	The attribute that will be considered the username to be searched against. Typical attributes to search for include: <code>uid</code> , <code>sAMAccountName</code> . Default: <code>sAMAccountName</code>

With the above configuration, the LDAP search filter takes the following form:

```
( & ( objectClass= * ) ( sAMAccountName= [ * * * USERNAME - ENTERED - BY - USER * * * ] ) )
```

Note: Setting `search_bind_authentication=true` tells Hue to perform an LDAP search using the bind credentials specified for the `bind_dn` and `bind_password` configuration properties. Hue will start searching the subtree starting from the base DN specified for the `base_dn` property. It will then search the base DN for an entry whose attribute, specified in `user_name_attr`, has the same value as the short name provided on login. The search filter, defined in `user_filter` will also be used to limit the search.

Direct Bind

The direct bind mechanism for authenticating binds to the LDAP server using the username and password provided at login.

Hue authenticates (without searching) in one of two ways:

- NT Domain (`nt_domain`): (Only for use with Microsoft Active Directory) Hue binds to the AD with `username@domain` using the User Principal Names (UPN) to bind to the LDAP service. This AD-specific property allows Hue to authenticate with AD without having to follow LDAP references to other partitions. This typically maps to the email address of the user or the user's ID in conjunction with the domain. Default: `mycompany.com`.
- Username Pattern (`ldap_username_pattern`): Bind to open standard LDAP with full path of directory information tree (DIT). It provides a template for the DN that is ultimately sent to the directory service when authenticating. The `[***USERNAME***]` parameter is replaced with the username provided at login.

Default:

```
"uid=[***USERNAME***],ou=People,dc=mycompany,dc=com"
```

Note: Setting `search_bind_authentication=false` tells Hue to perform a direct bind to LDAP using the credentials provided (not `bind_dn` and `bind_password` specified in the Advanced Configuration Snippet). There are two ways direct bind works depending on whether the `nt_domain` property is specified in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini`:

- `nt_domain` is specified: This is used to connect to an Active Directory service. In this case, the UPN is used to perform a direct bind. Hue forms the UPN by concatenating the short name provided at login with the `nt_domain`. For example, `[***SHORT-NAME***]@[***NT-DOMAIN***]`. The `ldap_username_pattern` property is ignored.
- `nt_domain` is not specified: This is used to connect to all other directory services (can handle AD, but `nt_domain` is the preferred way for AD). In this case, `ldap_username_pattern` is used and takes the following form:

```
cn=[***USERNAME-PROVIDED-AT-LOGIN***],dc=example,dc=com
```

Note: Username pattern does not work with AD because AD inserts spaces into the UID which Hue cannot process.

Encryption

To prevent credentials from transmitting in the clear, encrypt with LDAP over SSL, using the LDAPS protocol on the LDAPS port, which uses port 636 by default. An alternative, is to encrypt with the StartTLS operation using the standard LDAP protocol, which uses port 389 by default. Cloudera recommends LDAPS. You must have a CA Certificate in either case.

Table 1: Hue Supported LDAP authentication and encryption methods

LDAP Auth Action	Encrypted (LDAPS)	Encrypted (LDAP+TLS)	Not Encrypted (LDAP)
Search Bind	AD, LDAP	AD, LDAP	AD, LDAP
Direct Bind - NT Domain	AD	AD	AD
Direct Bind - User Pattern	LDAP	LDAP	LDAP

Prerequisites

To authenticate Hue users with LDAP, you must have:

- LDAP server
- Bind account (or support for anonymous binds)
- Cloudera Manager access with Full Administrator permissions
- [optional] LDAP server with LDAPS or StartTLS encryption.

Important: To authenticate securely, configure your LDAP server with either LDAP over SSL (LDAPS) or StartTLS encryption. Both methods require a Certificate Authority (CA) chain in a .pem file.

Configuring authentication with LDAP and Search Bind

Search Bind authentication executes ldapsearch against one or more directory services and binds with the distinguished name (DN) and password. Hue searches the subtree from the base distinguished name. If the LDAP Username Attribute is set, Hue looks for an entry whose attribute has the same value as the short name given at login.

About this task

Important: Search Binding works with all directory service types. It is also the only method that allows synchronizing groups at login (set with sync_groups_on_login in a safety-valve).

Video: [Authenticate Hue with LDAP and Search Bind](#)

Figure 1: Video: Authenticate Hue with LDAP and Search Bind**Procedure**

1. Log on to Cloudera Manager and click Hue.
2. Click the Configuration tab and filter by scope=Service-wide and category=Security.
3. Set the following required properties:

Authentication Backend	desktop.auth.backend.LdapBackend
LDAP URL	<ul style="list-style-type: none"> • ldaps://<ldap_server>:636 if using Secure LDAP • ldap://<ldap_server>:389 if not using encryption Note: If ldaps:// is specified in the LDAP URL, then do not set LDAP TLS.
Enable LDAP TLS	<ul style="list-style-type: none"> • TRUE if not using Secure LDAP (LDAPS) but want to establish a secure connection using TLS • FALSE if using LDAPS or not encrypting
LDAP Server CA Certificate	/path_to_certificate/cert.pem
LDAP Search Base	DC=mycompany,DC=com
LDAP Bind User Distinguished Name	username@domain
LDAP Bind Password	bind_user_password
Use Search Bind Authentication	TRUE

Create LDAP users on login	TRUE
----------------------------	------

Note: To encrypt with TLS, set LDAP URL to `ldap://<ldap_server>:389` and check Enable LDAP TLS. For a proof of concept without encryption, use `ldap://<ldap_server>:389`, remove the value for LDAP Server CA Certificate, and uncheck Enable LDAP TLS.

4. You can optionally improve search performance with attributes and filters:

LDAP User Filter	<code>objectclass=user (default = *)</code>
LDAP Username Attribute	<code>sAMAccountName (AD default), uid (LDAP default)</code>
LDAP Group Filter	<code>objectclass=group (default = *)</code>
LDAP Group Name Attribute	<code>cn (default)</code>
LDAP Group Membership Attribute	<code>member (default)</code>

Note: With the user settings in the table above, the LDAP search filter has the form: `(&(objectClass=user)(sAMAccountName=<user entered username>))`.

5. Add any valid user and/or valid group to quickly test your LDAP configuration:

LDAP Username for Test LDAP Configuration	Any valid user
LDAP Group Name for Test LDAP Configuration	Any valid group

6. Click Save Changes.

7. Test your LDAP configuration, and when successful click Restart Hue.

Note: The syntax of Bind Distinguished Name differs per bind method:

- Search Bind: `username@domain`
- Direct Bind with NT Domain: `username`
- Direct Bind with Username Pattern: DN string (full DIT path)

Do not use if anonymous binding is supported.

You can test `ldapssearch` at the command line as follows:

```
LDAPTLS_CACERT=/<path_to_cert>/<ca_certificate> ldapssearch -H ldaps://<ldap_server>:636 \
-D "<bind_dn>" -w <bind_password> -b <base_dn> "samaccountname=<user>"
```

Note: To run `ldapssearch` with a CA certificate, you may need to install `ldap_utils` on Debian/Ubuntu and `openldap-clients` on RHEL/CentOS.

Configuring authentication with LDAP and Direct Bind

To authenticate with Direct Binding, Hue needs either the User Principal Name (UPN) for Active Directory, or the full path to the LDAP user in the Directory Information Tree (DIT) for open standard LDAP.

About this task

Important: Direct binding only works with one domain. For multiple directories, use search bind.

Video: [Authenticate Hue with LDAP and Direct Bind](#)

Figure 2: Video: Authenticate Hue with LDAP and Direct Bind

To directly bind to an Active Directory/LDAP server with NT domain:

Procedure

1. Log in to Cloudera Manager and click Hue.
2. Click the Configuration tab and filter by scope=Service-wide and category=Security.
3. Set the following LDAP properties:

Authentication Backend	desktop.auth.backend.LdapBackend
LDAP URL	<ul style="list-style-type: none"> • ldaps://<ldap_server>:636 if using Secure LDAP • ldap://<ldap_server>:389 if not using encryption Note: If ldaps:// is specified in the LDAP URL, then do not set LDAP TLS.
Enable LDAP TLS	<ul style="list-style-type: none"> • TRUE if not using Secure LDAP (LDAPS) but want to establish a secure connection using TLS • FALSE if using LDAPS or not encrypting
LDAP Server CA Certificate	/path_to_certificate/cert.pem
LDAP Search Base	DC=mycompany,DC=com
LDAP Bind User Distinguished Name	<username> Only the username is required for Direct Bind. There is no need to specify the domain.
LDAP Bind Password	bind_user_password
Active Directory Domain	<your NT domain>
Use Search Bind Authentication	FALSE
Create LDAP users on login	TRUE

4. Click Save Changes
5. Test your LDAP configuration, and when successful, click Restart Hue.

To directly bind to an open standard LDAP server with a username pattern:

- a. Remove the value for the Active Directory Domain.
- b. Set both LDAP Username Pattern and LDAP Bind User Distinguished Name to a DN string that represents the full path of the directory information tree, from UID to top level domain.

Note: When using Direct Bind, set the LDAP Search Base property. This is not for authentication because you can log in to Hue without it, but to synchronize Hue with the LDAP server.

Configuring Hue for authentication against multiple LDAP/Active Directory servers

Some organizations have more than one LDAP or Active Directory (AD), and users in one LDAP/AD may not be present in the other. Hue supports the ability to authenticate users against multiple LDAP/AD servers.

Before you begin

Before attempting LDAP authentication against multiple servers, ensure you have configured LDAP synchronization for each server, as described in the previous sections. As long as users and groups are synchronised across LDAP and Hue, authentication should work.

Procedure

1. Log in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini , and add the following lines for each LDAP server:

```
[desktop]
[[ldap]]
[[[ldap_servers]]]
```

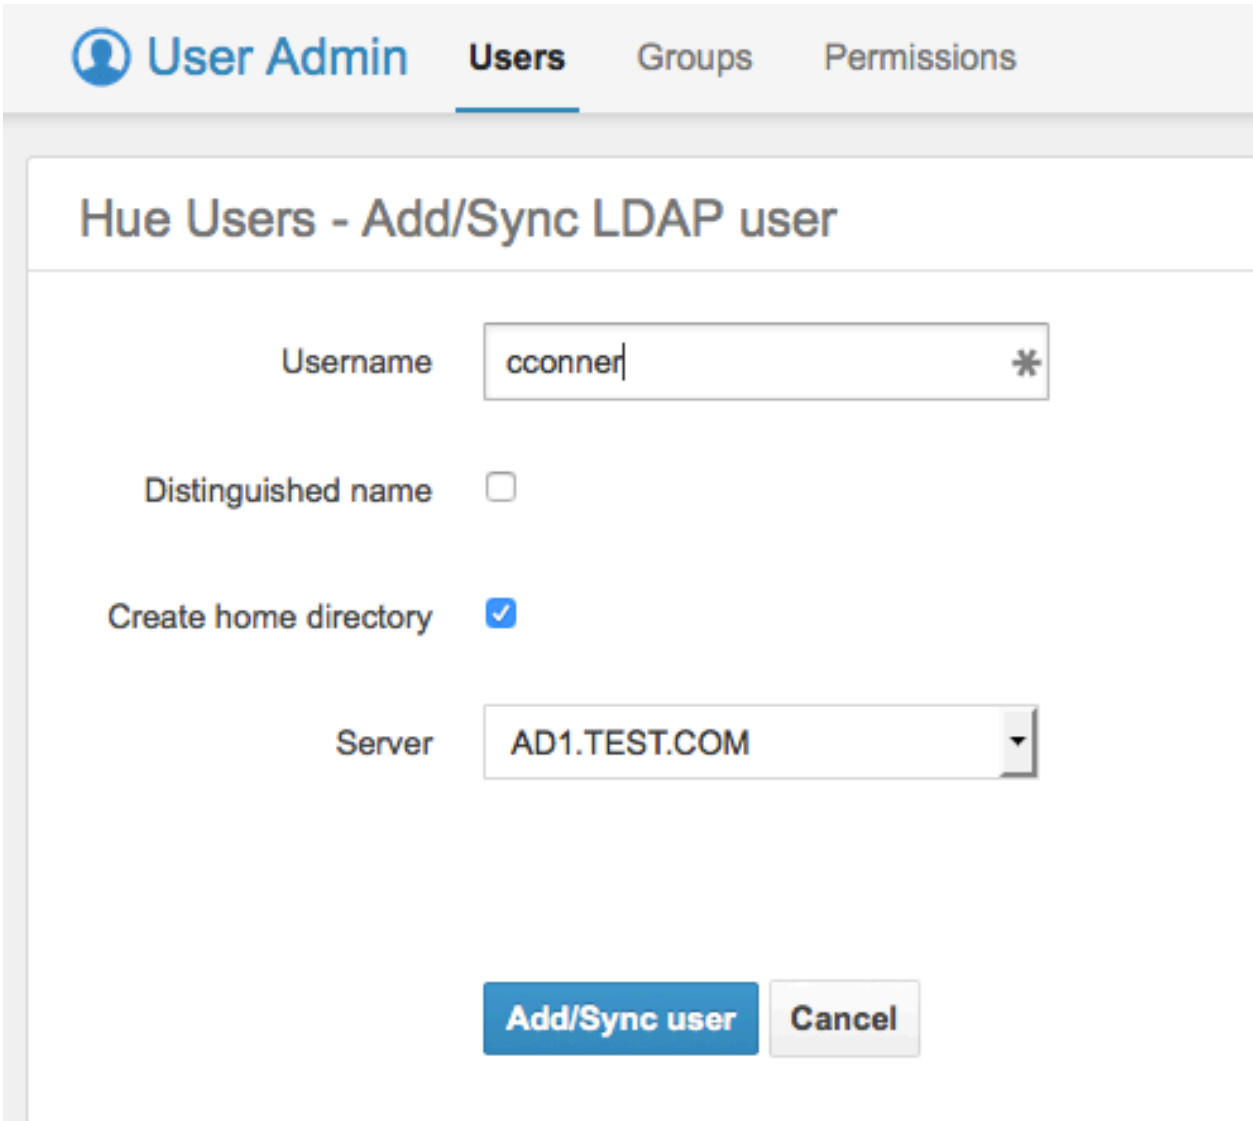

```
[[[AD1.TEST.COM]]]  
ldap_url=ldap://w2k8-ad1  
search_bind_authentication=true  
create_users_on_login=true  
base_dn="cn=users,dc=ad1,dc=test,dc=com"  
bind_dn="cn=Administrator,cn=users,dc=ad1,dc=test,dc=com"  
bind_password="[***PASSWORD***]"  
[[[AD2.TEST.COM]]]  
ldap_url=ldap://w2k8-ad2  
search_bind_authentication=true  
create_users_on_login=true  
base_dn="cn=users,dc=ad2,dc=test,dc=com"  
bind_dn="cn=Administrator,cn  
bind_password="[***PASSWORD***]"
```

The above code snippet is for a demo LDAP server called "AD1.TEST.COM" and "AD2.TEST.COM".

3. Click Save Changes.
4. Restart the Hue service.

Results

When you log into Hue or while synchronizing LDAP users from the Hue web interface, you need to select the LDAP/AD server from the dropdown list.

The screenshot shows the Hue User Admin interface with the 'Users' tab selected. The main heading is 'Hue Users - Add/Sync LDAP user'. The form contains the following fields and options:

- Username:** A text input field containing 'cconner' with an asterisk icon on the right.
- Distinguished name:** A checkbox that is currently unchecked.
- Create home directory:** A checkbox that is currently checked.
- Server:** A dropdown menu showing 'AD1.TEST.COM'.

At the bottom of the form, there are two buttons: 'Add/Sync user' (in blue) and 'Cancel' (in grey).

Testing the LDAP configuration

You can test your Hue LDAP configuration without restarting the Hue service. Add the values and save your changes.

Procedure

1. Configure Hue to authenticate with LDAP by using search bind or direct bind.
2. Add a user and group name for Test LDAP Configuration.
3. Click Save Changes.
4. Select ActionsTest LDAP Configuration.

5. Click Test LDAP Configuration:

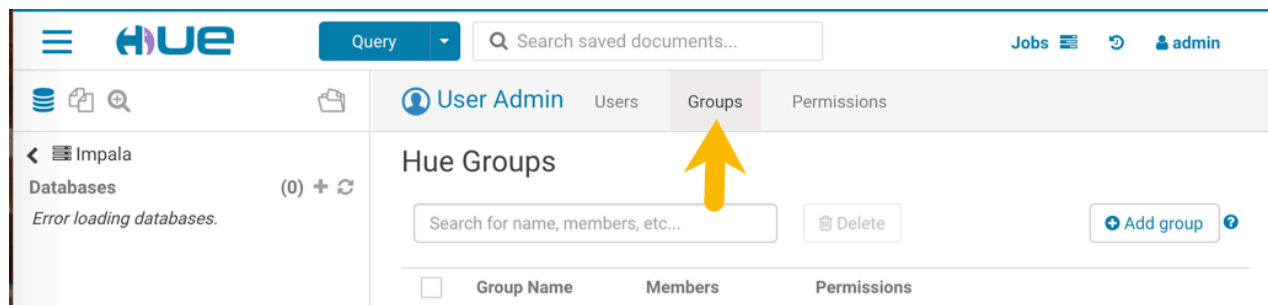

6. Click Restart Hue. When the test succeeds, log in to the Hue Web UI.

Configuring group permissions

You can configure permissions for members of groups on the Groups tab of the Hue User Admin application.

About this task

Note: A best practice is to remove all permissions from the default group and assign permissions as appropriate to your own groups.

Procedure

1. Log on to the Hue UI as a superuser.
2. Go to User AdminGroups.
3. Click the name of the group you want to alter.
4. Deselect any users that you do not want to change (all users in the group are selected by default).
5. Select or deselect the permissions you want to apply or remove.
6. Click Update Group.

Enabling LDAP authentication with HiveServer2 and Impala

LDAP authentication with HiveServer2 and Impala can be enabled by setting the `auth_username` and `auth_password` properties under the `[beeswax]` section for Hive and the `[impala]` section for Impala in a Cloudera Manager safety valve configuration property.

Important: Set these properties in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` property.

<code>auth_username</code>	LDAP username of the Hue user to be authenticated to the server.
<code>auth_password</code>	LDAP password of the Hue user to be authenticated to the server.

For example:

```
[beeswax]
  auth_username=<hiveserver2_ldap_user_name>
  auth_password=<hiveserver2_ldap_password>
[impala]
  auth_username=<impala_ldap_user_name>
  auth_password=<impala_ldap_password>
```

These login details are only used by Impala and Hive to authenticate to the LDAP server. The Impala and Hive services trust Hue to have already validated the user being impersonated instead of passing on the credentials.

LDAP properties

These are the properties you can use to configure LDAP for Hue in Cloudera Manager or in the `hue.ini` file for unmanaged clusters.

Property Name	Description and Syntax
General Hue LDAP Properties	
Authentication Backend <code>backend</code>	Authentication Mode. Select <code>desktop.auth.backend.LdapBackend</code> . Multiple backends are allowed. Create a list and add it to the Hue safety-valve.
LDAP URL <code>ldap_url</code>	URL for the LDAP server. Syntax: <code>ldaps://<ldap_server>:<636></code> or <code>ldap://<ldap_server>:<389></code> Important: To prevent usernames and passwords from transmitting in the clear, use <code>ldaps://</code> or <code>ldap:// + "Enable LDAP TLS"</code> .
Create LDAP users on login <code>create_users_on_login</code>	Flag to create new LDAP users at Hue login. If true, any user who logs into Hue is automatically created. If false, only users that exist in useradmin can log in.
Direct Bind Properties	
Active Directory Domain <code>nt_domain</code>	For direct binding with Microsoft Active Directory only. Typically maps to the user email address or ID in conjunction with the domain. Allows Hue to authenticate without having to follow LDAP references to other partitions. Hue binds with User-Principal-Name (UPN) if provided. Example: <code>ad.<mycompany>.com</code> Important: Do not use <code>nt_domain</code> with LDAP Username Pattern or Search Bind.
LDAP Username Pattern <code>ldap_username_pattern</code>	For direct binding with LDAP (non-Active Directory) only (because AD uses UPNs which have a space in them). Username Pattern finds the user attempting to login into LDAP by adding the username to a predefined DN string. Use <code><username></code> to reference the user logging in. An example is <code>"uid=<username>,ou=people,dc=mycompany,dc=com"</code> .
Search Bind Properties	
Use Search Bind Authentication <code>search_bind_authentication</code>	Flag to enable/disable Search Bind.
LDAP Search Base <code>base_dn</code>	Distinguished name to use as a search base for finding users and groups. Syntax: <code>dc=ad, dc=sec, dc=mycompany, dc=com</code>

Property Name	Description and Syntax
Encryption Properties	
LDAP Server CA Certificate ldap_cert	Full path to .pem file with Certificate Authority (CA) chain used to sign the LDAP server certificate. If left blank, all certificates are trusted and otherwise encrypted usernames and passwords are vulnerable to attack.
Enable LDAP TLS use_start_tls	Flag to enable/disable encryption with the StartTLS operation.
Import / Sync Properties	
LDAP Bind User Distinguished Name bind_dn	Bind user. Only use if LDAP/AD does not support anonymous binds. (Typically, LDAP supports anonymous binds and AD does not.) Bind User differs per auth type: <ul style="list-style-type: none"> • Search Bind: username@domain • Direct Bind with NT Domain: username • Direct Bind with Username Pattern: DN string (and same as LDAP Username Pattern)
LDAP Bind Password bind_password	Bind user password.
Filter Properties	
LDAP User Filter user_filter	General LDAP text search filter to restrict search of valid users. Only used by Search Bind authentication and LDAP Sync. The default is objectclass=* but can differ. For example, some LDAP environments support Posix objects for *nix authentication and the user filter might need to be objectclass=posixAccount.
LDAP Username Attribute user_name_attr	Username to search against (the attribute in LDAP that contains the username). Typical attributes include sAMAccountName (default for AD/LDAP) and uid (LDAP default). Maintain case sensitivity when setting attributes for AD/LDAP.
LDAP Group Filter group_filter	General LDAP text search filter to restrict search of valid groups. Only used by LDAP Sync (not authentication). If left blank, no filtering is used and all groups in LDAP are synced. The default is objectclass=* but can differ. For example, some LDAP environments support Posix objects for *nix authentication and the user filter might need to be objectclass=posixGroup.
LDAP Group Name Attribute group_name_attr	Group name to search against (the attribute in LDAP that contains the groupname). If left blank, the default is "cn" (common name), that typically works with AD/LDAP. Maintain case sensitivity when setting attributes for AD/LDAP.
LDAP Group Membership Attribute group_member_attr	Attribute in the group that contains DNs of all the members.(Optional) - If left blank, the default is "memberOf" or "member", that typically works with Active Directory/LDAP.
Test Properties	
LDAP Username for Test LDAP Configuration test_ldap_user	Any user (ideally with low privileges) used to verify the LDAP configuration.
LDAP Group Name for Test LDAP Configuration test_ldap_group	Any group (and not necessarily one that includes the test user) used to verify the LDAP configuration.

Configuring LDAP on unmanaged clusters

If your clusters are not managed with Cloudera Manager, you must manually set the LDAP configuration properties in the hue.ini file.

Refer to the following examples of LDAP configurations in the hue.ini file:

Example of a Search Bind configuration encrypted with LDAPS:

```
[[custom]]
[[auth]]
backend=desktop.auth.backend.LdapBackend

[[ldap]]
ldap_url=ldaps://<hostname>.ad.sec.<domain_name>.com:636
search_bind_authentication=true
ldap_cert=/<path_to_cacert>/<cert_filename>.pem
use_start_tls=false
create_users_on_login=true
base_dn="DC=ad,DC=sec,DC=<domain_name>,DC=com"
bind_dn="<username>@ad.sec.<domain_name>.com"
bind_password_script=<path_to_password_script>/<script.sh>
test_ldap_user="testuser1"
test_ldap_group="testgroup1"

[[[users]]]
user_filter="objectclass=user"
user_name_attr="sAMAccountName"

[[[groups]]]
group_filter="objectclass=group"
group_name_attr="cn"
group_member_attr="member"
```

Example of a Direct Bind configuration for Active Directory encrypted with LDAPS:

```
[[ldap]]
ldap_url=ldaps://<hostname>.ad.sec.<domain_name>.com:636
search_bind_authentication=false
nt_domain=ad.sec.<domain_name>.com
ldap_cert=/<path_to_cacert>/<cert_filename>.pem
use_start_tls=false
create_users_on_login=true
base_dn="DC=ad,DC=sec,DC=<domain_name>,DC=com"
bind_dn="<username>"
bind_password_script=<path_to_password_script>/<script.sh>
...
```

Example of a Direct Bind configuration for Active Directory encrypted with StartTLS:

```
[[ldap]]
ldap_url=ldap://<hostname>.ad.sec.<domain_name>.com:389
search_bind_authentication=false
nt_domain=ad.sec.<domain_name>.com
ldap_cert=/opt/cloudera/security/cacerts/<cert_filename>.pem
use_start_tls=true
create_users_on_login=true
base_dn="DC=ad,DC=sec,DC=<domain_name>,DC=com"
bind_dn="<username>"
bind_password_script=<path_to_password_script>/<script.sh>
...
```

Authenticating Hue users with SAML

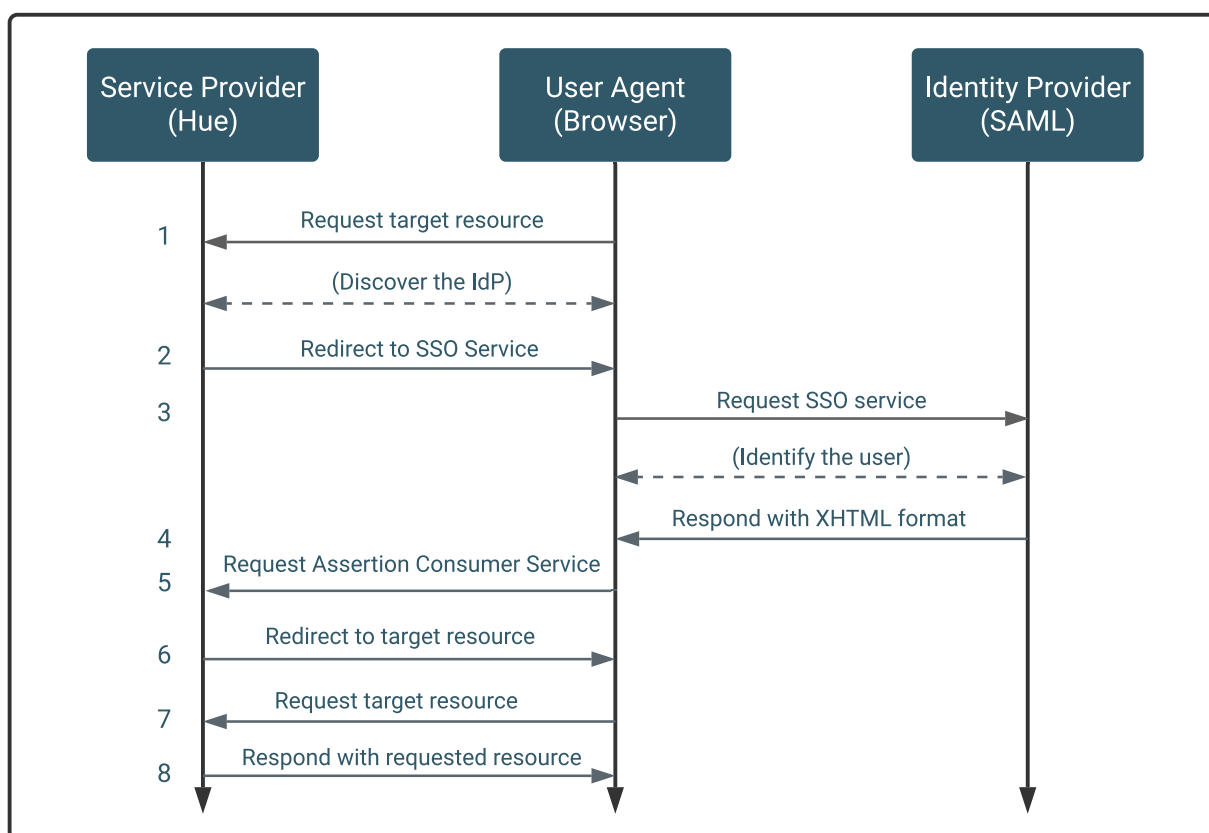

Hue supports SAML (Security Assertion Markup Language) for Single Sign-on (SSO) authentication.

The SAML 2.0 Web Browser SSO profile has three components:

- User Agent - Browser that represents you, the user, seeking resources.
- Service Provider (SP) - Service (Hue) that sends authentication requests to SAML.
- Identity Provider (IdP) - SAML service that authenticates users.

When a user requests access to an application, the Service Provider (Hue) sends an authentication request from the User Agent (browser) to the identity provider. The identity provider authenticates the user, sends a response, and redirects the browser back to Hue as shown in the following diagram:

Figure 3: SAML SSO protocol flow in a web browser

The Service Provider (Hue) and the identity provider use a metadata file to confirm each other's identity. Hue stores metadata from the SAML server, and the identity provider stores metadata from the Hue server.

Configuring SAML authentication on managed clusters

To configure Hue for SAML authentication on managed clusters, you must add the SAML authentication properties to the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` in Cloudera Manager.

Before you begin

These instructions assume that you have an Identity Provider set up and running. You can use any identity provider of your choice. For example, Okta, Ping Identity, and OpenAM.

Procedure

1. Log on to Cloudera Manager and go to HueConfiguration.
2. In the search text box, enter `hue_safety_valve.ini` to locate the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini`.
3. Enter the SAML parameters into the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` text box. For example:

```
## Example Settings using Open AM:
[desktop]
redirect_whitelist="^\./.*$,^https://\./idp.example.com:8080\./.*$"
[[auth]]
backend=libsaml.backend.SAML2Backend
[libsaml]
want_response_signed=True
want_assertions_signed=True
xmlsec_binary=/usr/bin/xmlsec1
metadata_file=/opt/cloudera/security/saml/idp-metadata.xml
key_file=/opt/cloudera/security/saml/host.key
cert_file=/opt/cloudera/security/saml/host.pem
key_file_password=Config(
    key="key_file_password",
    help=_t("key_file_password password of the private key"),
    default=None) ## If using encrypted private key
username_source=nameid
name_id_format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified"
entity_id=[**HOST-BASE-NAME**]
logout_enabled=false
```

If you are using an encrypted private key file, then you must specify the password in the `key_file_password` property. Or you can use an unencrypted private key file.

To create an unencrypted private key file from an encrypted key:

- a. SSH into a terminal as a root user.
- b. Change to the directory where you have stored the ssl certificate key.
- c. Run the following command:

```
openssl rsa -in ssl_certificate.key -out ssl_certificate-nocrypt.key
```

- d. When prompted, enter the password that you use to access the `ssl_certificate.key` file.

The output file (`ssl_certificate-nocrypt.key`) is an unencrypted PEM-formatted key.

Note: For SLES distributions, the `xmlsec` binary may be located in `/usr/local/bin/`. If so:

- Set `xmlsec_binary=/usr/local/bin/xmlsec1` in the Hue Service Advanced Configuration Snippet.
- Set `LD_LIBRARY_PATH=$LD_LIBRARY_PATH:/usr/local/lib/` in the Hue Service Environment Advanced Configuration Snippet.

4. Go to Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` and comment or remove any Knox-SSO configurations, if present.

Caution: Knox-SSO and SAML are incompatible and mutually exclusive. Hue authentication may fail with a redirection loop if you have the Knox-SSO and SAML configurations present in the Hue Advanced Configuration Snippet at the same time, as it confuses the authentication redirect to the IdP and back to Hue.

5. Click Save Changes, then select, ActionsRestart Hue.

Manually configuring SAML authentication

To manually configure Hue for SAML authentication on unmanaged clusters, you must add GCC Python libraries and install `xmlsec1` tools on all the hosts in your cluster.

Before you begin

These instructions assume that you have an Identity Provider set up and running. You can use any identity provider of your choice. For example, Okta, Ping Identity, and OpenAM.

Important: You may need to disable cipher algorithms before manually configuring Hue for SAML authentication.

Procedure

1. Install the following libraries on all hosts in your cluster:

```
## RHEL/CentOS
yum install git gcc python-devel swig openssl
```

```
## Ubuntu/Debian
apt-get install git gcc python-dev swig openssl
```

```
## SLES
zypper install git gcc python-devel swig openssl make libxslt-devel libl
tdl-devel
```

2. Install `xmlsec1` and `xmlsec1-openssl` on all hosts in the cluster:

Important: Ensure that the `xmlsec1` package is executable by the user, `hue`.

```
## RHEL/CentOS
yum install xmlsec1 xmlsec1-openssl
```

Note: If `xmlsec` libraries are not available, use the appropriate epel repository:

```
## For RHEL/CentOS 7
wget http://dl.fedoraproject.org/pub/epel/7/x86_64/e/epel-relea
se-7-6.noarch.rpm
rpm -ivh epel-release-7-6.noarch.rpm
```

```
## Ubuntu/Debian
apt-get install xmlsec1 libxmlsec1-openssl
```

```
## SLES (get latest version)
wget http://www.aleksey.com/xmlsec/download/xmlsec1-1.2.24.tar.gz
tar -xvzf xmlsec1-1.2.24.tar.gz
cd xmlsec1-1.2.24
./configure && make
make install
```

3. Copy metadata from your identity provider's SAML server and save it as an XML file on every host with a Hue server. For example, if your identity provider is Shibboleth, visit https://<idp_host>:8443/idp/shibboleth, copy the metadata content, and paste it into an XML file. Read the documentation of your identity provider for details on how to copy the XML of the SAML server metadata.

Note: You may have to edit the copied metadata; for example, the identity provider's port number (8443) might be missing from its URL.

```
mkdir -pm 755 /opt/cloudera/security/saml/
```

```
cd /opt/cloudera/security/saml/
```

```
vim idp-<your idp provider>-metadata.xml
# Paste IdP SAML here and save
```

4. Add the files that the `key_file` and `cert_file` SAML properties point to for encrypted assertions and make sure you add this properties to the `hue.ini` configuration file.
 - The `key_file` parameter points to the location of the private key that is used to encrypt metadata. Its file format must be `<file_name>.PEM`.
 - The `cert_file` parameter points to the location of the X.509 certificate that is sent with encrypted metadata. Its file format must be `<file_name>.PEM`.

Warning:

Add the key and cert files even if you are not encrypting assertions. Hue checks for the existence and validity of these files even if they are not needed. They cannot be empty files. This is a known issue. If necessary, create a valid self-signed certificate:

```
openssl req -x509 -newkey rsa:2048 -sha256 -days 3560 -nodes -keyout
host.key -out host.pem -subj '/CN=Hue SAML'
```

Integrating your identity provider's SAML server with Hue

After Hue is configured for SAML authentication and restarted, copy the metadata that is generated by the Hue server and send it to your identity provider so they can configure the SAML server.

Before you begin

Ensure that you have configured Hue for SAML authentication and restarted it before you integrate your identity provider's SAML server with Hue.

Procedure

1. Ensure Hue is configured, restarted, and running.
2. Go to `http://<hue_fqdn>:8889/saml2/metadata`.
3. Copy the metadata and send it to your identity provider.
4. Ensure that your identity provider configures the SAML server with the Hue metadata. It is the same process you used to configure the Hue server with SAML metadata.

SAML properties

You can set SAML properties in the `hue.ini` file for unmanaged clusters. A subset of them can be set in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` for managed clusters.

Table 2: Table of SAML parameters

SAML parameter	Description
<code>authn_requests_signed</code>	Boolean, that when True, signs Hue-initiated authentication requests with X.509 certificate.
<code>backend</code>	Hard-coded value set to SAML backend library packaged with Hue (<code>libsaml.backend.SAML2Backend</code>).
<code>base_url</code>	URL that SAML Identity Provider uses for responses. Typically used in Load balanced Hue environments.
<code>cert_file</code>	Path to X.509 certificate sent with encrypted metadata. File format must be <code>.PEM</code> .
<code>create_users_on_login</code>	Boolean, that when True, creates users from OpenId, upon successful login.
<code>entity_id</code>	Service provider ID. Can also accept pattern where ' <code><base_url></code> ' is replaced with server URL base.

SAML parameter	Description
key_file	Path to private key used to encrypt metadata. File format must be .PEM.
key_file_password	Password used to decrypt the X.509 certificate in memory.
logout_enabled	Boolean, that when True, enables single logout.
logout_requests_signed	Boolean, that when True, signs Hue-initiated logout requests with an X.509 certificate.
metadata_file	Path to readable metadata XML file copied from Identity Provider.
name_id_format	Format of NameID that Hue requests from SAML server.
optional_attributes	Comma-separated list of optional attributes that Hue requests from Identity Provider.
required_attributes	Comma-separated list of required attributes that Hue requests from Identity Provider. For example, uid and email.
redirect_whitelist	Fully qualified domain name of SAML server: " <code>^\/.*\$,^https:\/\/<SAML_server_FQDN>\/.*\$</code> ".
user_attribute_mapping	Map of Identity Provider attributes to Hue django user attributes. For example, {'uid':'username', 'email':'email'}.
username_source	Declares source of username as nameid or attributes.
want_response_signed	A boolean parameter, when set to True, requires SAML response wrapper returned by an IdP to be digitally signed by the IdP. The default value is False.
want_assertions_signed	A boolean parameter, when set to True, requires SAML assertions returned by an IdP to be digitally signed by the IdP. The default value is False.
xmlsec_binary	Path to xmlsec_binary that signs, verifies, encrypts/decrypts SAML requests and assertions. Must be executable by user, hue.

SAML properties that can be set for managed clusters

- `redirect_whitelist` [desktop]

Set to the fully qualified domain name of the SAML server so that Hue can redirect to the SAML server for authentication.

```
[desktop]
redirect_whitelist=^\/.?$,^https:\/\/\/<SAML_server_fully_qualified_domain_name>\/.?$
```

Note: Hue uses `redirect_whitelist` to protect itself from redirecting to unapproved URLs.

- `backend` [desktop]>[[auth]]

Point to the SAML backend that is packaged with Hue:

```
backend=libsaml.backend.SAML2Backend
```

- `xmlsec_binary` [libsaml]

Point to the `xmlsec1` library path:

```
xmlsec_binary=/usr/bin/xmlsec1
```

Note: To find the path, run: `which xmlsec1`

- `metadata_file` [libsaml]

Point to the path of the XML file you created from the identity provider's metadata:

```
metadata_file=/path/to/<your_idp_metadata_file>.xml
```

- `key_file` and `cert_file` [libsaml]

To encrypt communication between Hue and the Identity Provider (IdP), you need a private key and certificate. The private key signs requests sent to the IdP, and decrypts messages from the IdP. The certificate is used to encrypt messages to Hue from the IdP, and must be provided to the IdP. Typically, the `cert_file` is shared by providing Hue's Service Provider metadata XML to the IdP admins, but you may also share a copy of the `cert_file` itself.

The SAML certificate and private key must be the same on all Hue Server hosts, and can be self-signed, obtained from a commercial CA vendor, or from your internal PKI administrators. Both `key_file` and `cert_file` must be in PEM format.

Users with password-protected certificates can set the property, `key_file_password` in the `hue.ini` file. Hue uses the password to decrypt the SAML certificate in memory and passes it to `xmlsec1` through a named pipe. The decrypted certificate never touches the disk. This only works for POSIX-compatible platforms.

Troubleshooting SAML authentication

Before troubleshooting your SAML authentication configuration in Hue, enable DEBUG for the Hue Django logs that are located in `/var/log/hue`. In the Hue Web UI, go to the Home page, select Server Logs, and check Force Debug Level. For managed clusters, you can use Cloudera Manager to enable DEBUG by navigating to the Hue service, selecting the Configuration tab, check Enable Django Debug mode, click Save Changes, and then Restart.

SAML SSL error

OpenSSL might fail with this message:

```
SSLError: [Errno bad handshake] [('SSL routines', 'SSL3_CHECK_CERT_AND_ALGORITHM', 'dh key too small')]
```

To resolve, append the following code to the file, `/usr/java/<your_jdk_version>-cloudera/jre/lib/security/java.security`:

```
jdk.tls.disabledAlgorithms=MD5, RC4, DH
```

SAML decrypt error

The following error is an indication that you are using a slightly different SAML protocol from what Hue expects:

```
Error: ('failed to decrypt', -1)
```

To resolve:

1. Download and rename the `fix-xmlsec1.txt` Python script.

```
wget https://www.cloudera.com/documentation/other/shared/fix-xmlsec1.txt -O fix-xmlsec1.py
```

2. Change permissions as appropriate, for example:

```
chmod 755 fix-xmlsec1.py
```

3. In `hue.ini`, set `xmlsec_binary=<path_to_script>/fix-xmlsec1.py`.
4. Run `fix-xmlsec1.py`.

This script repairs the known issue whereby `xmlsec1` is not compiled with `RetrievalMethod` and cannot find the location of the encrypted key. SAML2 responses would sometimes place `EncryptedKey` outside of the `EncryptedData` tree. This script moves `EncryptedKey` under `EncryptedData`.

Authenticating Hue users with Knox SSO

You can use the Apache Knox Gateway to interact with Hue REST APIs and the Hue user interface, along with other CDP components and services. To set up Knox Single Sign-on (SSO) to authenticate users, you must configure the KnoxSpnegoDjangoBackend property using Cloudera Manager.

Before you begin

To authenticate users using Knox SSO, you must have Knox installed on your CDP cluster, also known as a secure cluster.

Procedure

1. Sign in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configurations and search for the Authentication Backend field.
3. Select `desktop.auth.backend.KnoxSpnegoDjangoBackend` from the dropdown.

4. Go to Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` and comment or remove any SAML-specific configurations, if present.

Caution: Knox-SSO and SAML are incompatible and mutually exclusive. Hue authentication may fail with a redirection loop if you have the Knox-SSO and SAML configurations present in the Hue Advanced Configuration Snippet at the same time, as it confuses the authentication redirect to the IdP and back to Hue.

5. Click Save Changes.
6. Go to Clusters \$Knox service Instances and note down the hostnames of the Knox Gateways.

You must provide these details in the next step.

If you have set up Knox in High-Availability (HA) mode, then you can see more than one Knox Gateways listed on the Instances tab.

7. Go back to Clusters Hue service Configurations and search for the Knox Proxy Hosts field.
8. Enter the hostname of the Knox Gateway that you noted earlier.

If you have set up Knox HA, then click + to add another hostname.

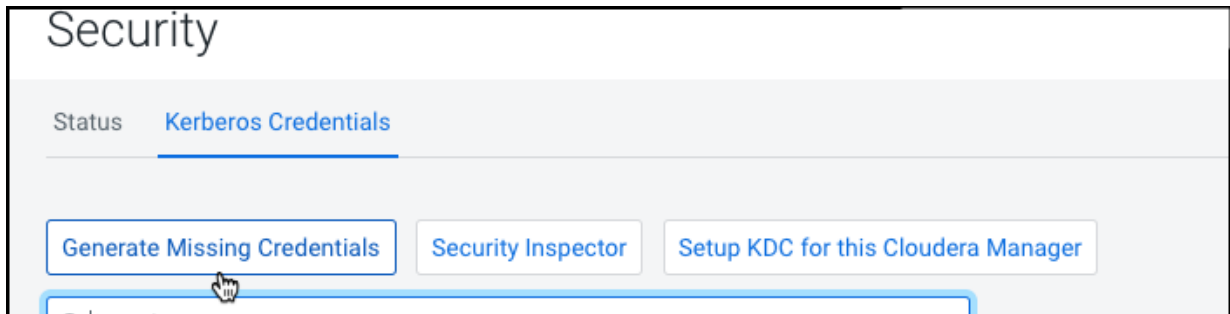

9. If you have deployed a Hue Load Balancer, then you must specify the Load Balancer hostname in the Knox Proxy Hosts field by clicking +.

- Click Save Changes.

You would see the following warning:

Role is missing Kerberos keytab. Go to the Kerberos Credentials page and click the Generate Missing Credentials button.

- Click Administration on the Cloudera Manager left navigation panel and select Security.
- Go to the Kerberos Credentials tab and click Generate Missing Credentials.

A pop-up showing the status is displayed.

- Go to Clusters Hue service and click Restart next to Actions.

- On the **Stale Configurations** page, click Restart Stale Services.
The **Restart Stale Services** wizard is displayed.
- On the Review Changes page, select Redeploy client configuration, and click Restart Now.
The **Command Details** page shows the live status as the service restarts.
When all the steps are complete, click Finish.

16. From the Hue service page, click **Web UI Knox Gateway UI**.

The Knox Gateway UI is displayed.

17. On the **General Proxy Information** page, expand the CDP Proxy topology by clicking + cdp-proxy under Topologies.

The list of services that are configured with the cdp-proxy topology is displayed.

18. Click on the Hue logo.

You should be able to log in to the Hue web UI.

You can also log into Hue using the following URL:

```
https://[***HOSTNAME***]:[***PORT***]/gateway/cdp-proxy/hue/
```

19. Go to **Clusters Knox Configuration** and add the following entries in the Knox Simplified Topology Management - cdp-proxy field:

```
HUE:httpclient.socketTimeout=[***TIMEOUT-IN-MINUTES***]
```

```
HUE:httpclient.connectionTimeout=[***TIMEOUT-IN-MINUTES***]
```

Replace `[***TIMEOUT-IN-MINUTES***]` with the actual timeout value depending on the load on your load on the cluster or environment. For example, to set a timeout of 20 minutes, specify 20m. The default timeout value is 5m.

Note: This step is required to prevent query timeouts, and if you are seeing errors such as “Results have expired, rerun the query if needed” in the Hue logs.

20. Restart the Knox service.

Authenticating Hue users with PAM

You can use Pluggable Authentication Modules (PAM) for authentication in Hue.

Procedure

1. Log in to Cloudera Manager as an Administrator.

- Go to Clusters Hue Configuration and select `desktop.auth.backend.PamBackend` from the Authentication Backend drop-down menu.

The default value of the PAM Backend Service Name property is “login”.

Note: On RHEL 9, you must change the value of PAM Backend Service Name to `sshd`.

- Click Save Changes.
- Restart the Hue service.

Applications and permissions reference

Hue is a web-based UI for several cluster services that you can access by using Hue applications and their associated permissions.

Hue applications

These CDP services are available in Hue. Currently, Spark is only available in the upstream version of Hue.

Hue Application	Application Dependencies
HBase	HBase Browser
HDFS	Core, File Browser
Hive	Metastore Tables, Hive Editor
Impala	Metastore Tables, Impala Editor
MapRed / YARN	Job Browser, Job Designer, Oozie, Hive Editor, Pig, Sqoop
Oozie	Job Designer, Oozie Editor/Dashboard
Solr (Search)	Hadoop Security
Spark	Spark

Hue application permissions

Hue application permissions are composed of `name.permission:action`.

For example, `filebrowser.access:Launch this application(3)`

In this example:

- `filebrowser` = Hue application name
- `access` = Execute permissions
- `Launch this application` = Action that is enabled
- `(3)` = Process ID of the filebrowser application in the Hue database

Hue Application	Permission	Read/Write/Execute	Action Description
about	access	execute	Launch this application
beeswax	access	execute	Launch this application
dashboard	access	execute	Launch this application
filebrowser	access	execute	Launch this application
filebrowser	s3_access	execute	Access to S3 from filebrowser and filepicker
filebrowser	adls_access	execute	Access to ADLS from filebrowser and filepicker

Hue Application	Permission	Read/Write/Execute	Action Description
filebrowser	abfs_access	execute	Access to ABFS from filebrowser and filepicker
filebrowser	gs_access	execute	Access to GS from filebrowser and filepicker
help	access	execute	Launch this application
hive	access	execute	Launch this application
impala	access	execute	Launch this application
indexer	access	execute	Launch this application
jobbrowser	access	execute	Launch this application
jobsub	access	execute	Launch this application
kafka	access	execute	Launch this application
metadata	access	execute	Launch this application
metadata	write	write	Allow edition of metadata like tags
metastore	access	execute	Launch this application
metastore	write	write	Allow DDL operations. Need the app access too
notebook	access	execute	Launch this application
oozie	access	execute	Launch this application
oozie	dashboard_jobs_access	execute	Oozie Dashboard read-only user for all jobs
oozie	disable_editor_access	execute	Disable Oozie Editor access
proxy	access	execute	Launch this application
rdbms	access	execute	Launch this application
search	access	execute	Launch this application
useradmin	access_view:useradmin:edit_user	read/write/execute	Access to profile page on User Admin
useradmin	access_view:useradmin:view_user	read/write/execute	Access to any profile page on User Admin
useradmin	access	execute	Launch this application

Securing Hue passwords with scripts

You can secure passwords in Hue by using one consolidated script, or multiple individual scripts. Hue runs each password script at startup and extracts passwords from stdout.

About this task

Store scripts in a directory that only Hue can read, write, and execute. You can choose password script names but you cannot change hue.ini property names to which you assign those scripts. Add the suffix `_script` to any password property and set it equal to the script name.

Procedure

1. At the command line, create one or more password scripts. For example, create a consolidated script named `my_passwords_script.sh`:

```
#!/bin/bash
SERVICE=$1
if [[ ${SERVICE} == "ldap_password" ]]
then
  echo "<your_ldap_password>"
fi

if [[ ${SERVICE} == "ssl_password" ]]
then
  echo "<your_ssl_password>"
fi

if [[ ${SERVICE} == "bind_password" ]]
then
  echo "<your_bind_password>"
fi

if [[ ${SERVICE} == "db_password" ]]
then
  echo "<your_database_password>"
fi
```

2. Log on to Cloudera Manager and go to HueConfiguration.
3. Search on Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini`.
4. Add script properties. In the following example, the required `_script` is added to the password property:

```
[desktop]
ldap_username=hueservice
ldap_password_script="/var/lib/hue/password_script.sh ldap_password"
ssl_password_script="/var/lib/hue/password_script.sh ssl_password"

[[ldap]]
bind_password_script="/var/lib/hue/password_script.sh bind_password"
[[database]]
db_password_script="/var/lib/hue/password_script.sh db_password"
```

5. Click Save Changes and Restart Hue.

Directory permissions when using PAM authentication backend

If you are using Pluggable Authentication Modules (PAM) for authenticating Hue users, then ensure that the Hue users have access to the `/etc/shadow` directory. Use an approach suitable to your organization's security policies.

Making Hue application user a member of the shadow group

This approach involves creating a “shadow” group and adding Hue to this group. Then you must grant the “shadow” group, read permission to the `/etc/shadow` directory.

Using Access Control Lists (Recommended)

You can use Linux's ACLs to permit Hue user a read permission to the `/etc/shadow` directory by using the `setfacl` command. Cloudera recommends this approach.

Configuring TLS/SSL for Hue

You can independently enable TLS/SSL for Hue.

Cloudera recommends that your cluster and the Hue service use Kerberos for authentication. If you enable TLS/SSL for a cluster that has not been configured to use Kerberos, a warning is displayed. You should integrate the cluster with your Kerberos deployment before proceeding.

Creating a truststore file in PEM format

You must create the Hue Truststore by consolidating certificates of all SSL-enabled servers (or a single CA Certificate chain) that Hue communicates with into one file. This generally includes certificates of all the Oozie, HDFS, MapReduce, and YARN daemons, and any other SSL-enabled services.

About this task

Server certificates are stored in Java KeyStore (JKS) format. The Hue Truststore must be in the Privacy Enhanced Mail (PEM) format whereas other services use the JKS format by default. To create the Hue truststore, extract each certificate from Hadoop's Java Keystore with the Java keytool, convert the certificate to PEM format with the OpenSSL.org openssl tool, and then add it to the Hue truststore:

Procedure

1. Extract the certificate from the keystore of each TLS/SSL-enabled server with which Hue communicates. For example, if you have `hadoop-server.keystore` that contains a server certificate, `foo-1.example.com` with a password of `example123`, you would use the following keytool command:

```
keytool -exportcert -keystore hadoop-server.keystore -alias foo-1.example.com -storepass example123 -file foo-1.cert
```

2. Convert each certificate into a PEM file. Here is what the openssl tool command looks like for the `foo-1.cert` file that was extracted in Step 1:

```
openssl x509 -inform der -in foo-1.cert > foo-1.pem
```

3. Concatenate all the PEM certificates you extracted and converted from the server truststore into one PEM file:

```
cat foo-1.pem foo-2.pem foo-n.pem ... > hue_truststore.pem
```

Concatenate the certificate files in the following order: SSL certificate followed by intermediate certificate, followed by the root CA certificate.

Important: Ensure the final PEM truststore is deployed in a location that is accessible by the Hue service.

4. Log in to Cloudera Manager as an Administrator.
5. Go to [Clusters Hue Configuration](#) and add the following line in the Hue Service Environment Advanced Configuration Snippet (Safety Valve) field:

```
REQUESTS_CA_BUNDLE=[ ***PATH-TO-HUETRUST.PEM-FIL E*** ]
```

6. Click Save Changes.
7. Restart the Hue service.

Configuring Hue as a TLS/SSL client

Hue acts as a TLS/SSL client when communicating with other services, such as core Hadoop, HBase, Oozie, and cloud providers like Amazon S3 or Azure.

To act as a TLS/SSL client, Hue must authenticate HDFS, MapReduce, YARN daemons, the HBase Thrift server, and so on. To do this, Hue needs to have the certificate chains of these components' hosts in the Hue trust store.

The Hue truststore is a single PEM (Privacy Enhanced Mail) file that contains the certificate authority (CA) root certificate and all intermediate certificates to authenticate the certificate installed on each TLS/SSL-enabled server. These servers host the services with which Hue communicates.

Note: A certificate is specific to a host. It is signed by a CA and tells the requesting client, which is Hue in this case, that the host is the same one as is represented by the host public key. Hue uses a chain of signing authority in its truststore to validate the CA that signed the host certificate.

Enabling Hue as a TLS/SSL client

After you create a Hue truststore file in PEM format, you can configure Hue as a TLS/SSL client by using Cloudera Manager.

Procedure

1. Log in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration Hue TLS/SSL Server CA Certificate (PEM Format) `ssl_cacerts` and add the path to the `hue_truststore.pem` file on the host that is running the Hue web server.
3. Click Save Changes.
4. Restart the Hue service.

Configuring Hue as a TLS/SSL server

Hue and other Python-based services expect certificates and keys to be stored in PEM (Privacy Enhanced Mail) format.

Before you enable TLS/SSL for the Hue server, you must generate a private key and certificate by using the `openssl` command-line tool and reuse a host's existing Java keystore by converting it to the PEM format.

Enabling Hue as a TLS/SSL server using Cloudera Manager

You can use Cloudera Manager to enable TLS/SSL for the Hue server.

Procedure

1. Log in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration and filter by SCOPE Hue Server and CATEGORY Security .

3. Edit the following Hue TLS/SSL properties according to your cluster configuration:

- Enable TLS/SSL for Hue: Select the check box to encrypt communication between clients and Hue with TLS/SSL.
- Hue TLS/SSL Server Certificate File (PEM Format) `ssl_certificate`: Specifies the path to the TLS/SSL certificate on the host that is running the Hue web server.

Ensure that you include the complete chain in the `ssl_certificate` PEM file.

The order of the certificates should be as follows from the top to bottom: server, intermediate, root.

If there are multiple intermediate CA certificates, then you must add them in the correct order. For example:

```
Subject: CN=Hue Server Certificate
Issuer: CN=Intermediate 2
```

```
Subject: CN=Intermediate 2
Issuer: CN=Intermediate 1
```

```
Subject: CN=Intermediate 1
Issuer: CN=RootCA
```

```
Subject: CN=RootCA
Issuer: CN=RootCA
```

- Hue TLS/SSL Server Private Key File (PEM Format) `ssl_private_key`: Specifies the path to the TLS/SSL private key on the host running the Hue web server.
 - Hue TLS/SSL Private Key Password `ssl_password`: Specifies the password for the private key in the Hue TLS/SSL Server Certificate and Private Key file.
 - Hue TLS/SSL Server CA Certificate (PEM Format) `ssl_cacerts`: Specifies the path to the TLS/SSL certificate authority root certificate on the host that is running the Hue web server.
4. Add the path to the certificate chain PEM file in [desktop] section of the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field:

```
[desktop]
ssl_certificate_chain=[ ***PATH*** ]/[ ***TO*** ]/[ ***FULL-CHAIN*** ].pem
```

5. Click Save Changes.

6. Select `ActionsRestart` to restart the Hue service.

What to do next

Change the permissions for Hue to read the certificates after you have enabled TLS/SSL as follows:

```
chmod 644 [ ***PATH-WHERE-SSL-FILES-FOR-HUE-ARE-LOCATED*** ]
```

Enabling TLS/SSL for Hue Load Balancer

To configure the Hue Load Balancer to use HTTPS or operate as a TLS/SSL server, you need a self-signed SSL certificate and a private key file. If the private key file is password protected, then you must configure the Hue Load Balancer to use the corresponding key password.

Procedure

1. Log in to Cloudera Manager as an Administrator.
2. Go to `Clusters Hue service Configuration Scope Load Balancer`.

3. Enter the location of the file that contains the server certificate key for TLS/SSL on the host running Hue Load Balancer in the Hue Load Balancer TLS/SSL Server Certificate File (PEM Format) field.

The certificate file must be in the Privacy-Enhanced Mail (PEM) format.

4. Enter the location of the TLS/SSL file that contains the private key used for TLS/SSL on the host running Hue Load Balancer, in the Hue Load Balancer TLS/SSL Server Private Key File (PEM Format) field.

The certificate file must be in PEM format.

5. (Optional) If the private key file is password protected perform the following steps:
 - a) Create a password file in your chosen security directory and insert the private key password as shown in the following example:

```
echo "abc123" > /etc/security/password.txt
```

Where abc123 is the private key password and password.txt is the password file.

- b) Set the file ownership and permissions as shown in the following example:

```
chown hue:hue password.txt
chmod 700 password.txt
```

- c) Enter the path to the file containing the passphrase used to encrypt the private key of the Hue Load Balancer server in the Hue Load Balancer TLS/SSL Server SSLPassPhraseDialog field.

6. Click Save Changes.

7. Restart the Hue service.

Enabling TLS/SSL communication with HiveServer2

For Hue to communicate with HiveServer2 using TLS/SSL, Hue needs the Hive certificate and certificate chain.

To enable TLS/SSL communication with HiveServer2, add the following properties in the [beeswax] section under [[ssl]] in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini configuration property:

Property	Description
[beeswax] [[ssl]] enabled	Valid values: true false Enables or disables TLS/SSL communication for this server. Default setting: false Example: enabled=true
[beeswax] [[ssl]] cacerts	Valid values: directory path Specifies the path to the Certificate Authority certificates. Default setting: /etc/hue/cacerts.pem Example: cacerts=/opt/cloudera/security/CAcerts/cacerts
[beeswax] [[ssl]] validate	Valid values: true false Specifies whether Hue validates certificates received from the server. Default setting: true Example: validate=true

Enabling TLS/SSL communication with Impala

For Hue to communicate with Impala using TLS/SSL, Hue needs the Impala certificate and certificate chain.

To enable TLS/SSL communication with Impala, add the following properties in the [impala] section under [[ssl]] in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini configuration property:

Property	Description
[impala] [[ssl]] enabled	Valid values: true false Enables or disables TLS/SSL communication for this server. Default setting: false Example: enabled=true
[impala] [[ssl]] cacerts	Valid values: directory path Specifies the path to the Certificate Authority certificates. Default setting: /etc/hue/cacerts.pem Example: cacerts=/opt/cloudera/security/CAcerts/cacerts
[impala] [[ssl]] validate	Valid values: true false Specifies whether Hue validates certificates received from the server. Default setting: true Example: validate=true

Securing database connections with TLS/SSL

Hue uses different clients to communicate with each database internally. Client-specific options, such as secure connectivity can be configured using Cloudera Manager.

Procedure

1. Log in to Cloudera Manager as an administrator.
2. Go to Clusters Hue service Configuration and add the following section in the Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini field:

```
[desktop]
  [[database]]
  ...
  options={"ssl":{"ca":"/tmp/ca-cert.pem"}}
```

This identifies the Certificate Authority (CA) certificate for the backend database. You can also identify public and private keys as follows:

```
options='{"ssl":{"ca":"/tmp/newcerts2/ca.pem", "key":"/tmp/newcerts2/client-key.pem", "cert":"/tmp/newcerts2/client-cert.pem"}}
```

3. Click Save Changes.
4. Restart the Hue service.

Disabling CA Certificate validation from Hue

By default, Hue validates CA Certificates for Oozie, HTTPFS, Resource Manager, and Job History Server when SSL is enabled for any of these services. If you have not enabled TLS/SSL on your cluster, then you can disable Hue from validating the CA Certificates for other services on your CDP cluster.

Procedure

1. Log in to Cloudera Manager as an Administrator.

- Go to **Clusters Hue Configuration** and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field:

```
[hadoop]
[[hdfs_clusters]]
[[[default]]]
ssl_cert_ca_verify = False #HTTPFS service
[[yarn_clusters]]
[[[default]]]
ssl_cert_ca_verify = False #Resource Manager/Job History Server
[[[ha]]]
ssl_cert_ca_verify = False #Resource Manager HA
[liboozie]
ssl_cert_ca_verify = False
```

- Click **Save Changes**.
- Restart the hue service.

Securing sessions

When a Hue session expires, the screen blurs and the user is automatically logged out of the Hue web interface. Logging back on returns the user to the same location in the application.

Session timeout

User sessions are controlled with the `ttl` (time-to-live) property, which is set in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` property as follows:

```
[desktop]
[[session]]
ttl=[**NUMBER-OF-SECONDS**]
```

The default setting for `ttl` is 1,209,600 seconds, which equals two weeks. The `ttl` property determines the length of time that the cookie with the user's session ID lives before expiring. After the `ttl` setting is reached, the user's session expires whether it is active or not.

Idle session timeout

Idle sessions are controlled with the `idle_session_timeout` property, which is set in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` property as follows:

```
[desktop]
[[auth]]
idle_session_timeout=[**NUMBER-OF-SECONDS**]
```

Sessions expire that are idle for the number of seconds set for this property. For example, if you set `idle_session_timeout=900`, sessions expire after being idle for 15 minutes. You can disable the property by setting it to a negative value, like `idle-session_timeout=-1`.

Secure session login

Session login properties are set under the `[desktop] [[auth]]` section in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` property as follows:

```
[desktop]
[[auth]]
[**SET-SESSION-LOGIN-PARAMETERS-HERE**]
```

Note: These configuration settings are based on [django-axes 1.5.0](#).

Use the following properties to configure session login behavior:

change_default_password	<p>Valid values: true false</p> <p>If this property is set to true, users must change their passwords on first login attempt.</p> <p>Example:</p> <pre>[desktop] [[auth]] change_default_password=true</pre> <p>To use this property, you must enable the AllowFirstUserDjangoBackend in Hue. For example:</p> <pre>[desktop] [[auth]] backend=desktop.auth.backend.AllowFirstUserDjangoBackend</pre>
expires_after	<p>Use this property to configure the number of seconds after logout that user accounts are disabled. For example, user accounts are disabled 900 seconds or 15 minutes after logout with the following configuration:</p> <pre>[desktop] [[auth]] expires_after=900</pre> <p>If you set this property to a negative value, user sessions never expire. For example, expires_after=-1.</p>
expire_superuser	<p>Use to expire superuser accounts after the specified number of seconds after logout. For example, expire_superuser=900 causes superuser accounts to expire 15 minutes after logging out.</p>
login_cooloff_time	<p>Sets the number of seconds after which failed logins are forgotten. For example, if you set login_cooloff_time=900, a failed login attempt is forgotten after 15 minutes.</p>
login_failure_limit	<p>Sets the number of login attempts allowed before a failed login record is created. For example, if you set login_failure_limit=3, a failed login record is created after 3 login attempts.</p>
login_lock_out_at_failure	<p>Valid values: true false</p> <p>If set to true:</p> <ul style="list-style-type: none"> • The IP address that is attempting to log in is locked out after exceeding the limit set for login_failure_limit. • If login_lock_out_by_combination_user_and_ip is also set to true, both the IP address and the user are locked out after exceeding the limit set for login_failure_limit. • If login_lock_out_use_user_agent is also set to true, both the IP address and the agent application (such as a browser) are locked out after exceeding the limit set for login_failure_limit.
login_lock_out_by_combination_user_and_ip	<p>Valid values: true false</p> <p>If set to true, both the IP address and the user are locked out after exceeding the limit set for login_failure_limit.</p>
login_lock_out_use_user_agent	<p>Valid values: true false</p> <p>If set to true, the agent application (such as a browser) is locked out after exceeding the limit set for login_failure_limit.</p>

Secure session cookies

Session cookie properties are set under the [desktop] [[session]] section in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini property as follows:

```
[desktop]
  [[session]]
  [***SET-SESSION-COOKIE-PROPERTIES-HERE***]
```

Use the following properties to configure session cookie behavior:

secure	<p>Valid values: true false</p> <p>If this property is set to true, the user session ID is secured.</p> <p> Important: To use this property, HTTPS must be enabled.</p> <p>Example:</p> <pre>[desktop] [[session]] secure=true</pre> <p>By default this property is set to false.</p>
http_only	<p>Valid values: true false</p> <p>If this property is set to true, the cookie with the user session ID uses the HTTP only flag.</p> <p>Example:</p> <pre>[desktop] [[session]] http_only=true</pre> <p> Important: If the HttpOnly flag is included in the HTTP response header, the cookie cannot be accessed through a client side script.</p> <p>By default this property is set to true.</p>
expire_at_browser_close	<p>Valid values: true false</p> <p>If this property is set to true, only session-length cookies are used. Users are automatically logged out when the browser window is closed.</p> <p>Example:</p> <pre>[desktop] [[session]] expire_at_browser_close=true</pre> <p>By default this property is set to false.</p>

Specifying HTTP request methods

You can specify the HTTP request methods that the Hue server responds to.

Use the http_allowed_methods property under the [desktop] section in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for hue_safety_valve.ini property.

By default, the http_allowed_methods property is set to options, get, head, post, put, delete, connect.

Restricting supported ciphers for Hue

You can configure the list of ciphers that Hue supports with HTTPS.

Use the `ssl_cipher_list` property under the `[desktop]` section in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` property:

```
[desktop]
ssl_cipher_list=[**LIST-OF-ACCEPTED-CIPHERS**]
```

By default, the `ssl_cipher_list` property is set to `!aNULL:!eNULL:!LOW:!EXPORT:!SSLv2`. Specify ciphers using the cipher list format described at [OpenSSL Cryptography and SSL/TLS Toolkit Manpages](#) by selecting the SSL version, and then going to `Commands ciphers`.

Specifying domains or pages to which Hue can redirect users

You can restrict the domains or pages to which Hue can redirect users.

Use the `redirect_whitelist` property under the `[desktop]` section in the Cloudera Manager Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` property:

```
[desktop]
redirect_whitelist=[**REDIRECT-URL**]
```

Specify the `redirect_whitelist` value with a comma-separated list of regular expressions that match the redirect URL. For example, to restrict redirects to your local domain and fully-qualified domain name (FQDN), use the following value:

```
redirect_whitelist=^\/.*$,^http:\/\/www.mydomain.com\/.*$
```

Securing Hue from CWE-16

Hue may have allowed external domains such as `doubleclick.net`, `googletagmanager.com`, or `*.google-analytics.com` to run JavaScript scripts, for certain URLs in the Content Security Policy (CSP) headers. This may lead to Common Weakness Enumeration (CWE-16). To secure Hue from CWE-16 class of weaknesses, you can add the `X-Content-Type-Options` response HTTP header and prevent attacks based on MIME-type confusions in Hue's Advanced Configuration Snippet using Cloudera Manager.

Procedure

1. Log in to Cloudera Manager as an Administrator.
2. Go to `Clusters Hue Configuration` and add the following lines in the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.in` field:

```
[desktop]
# X-Content-Type-Options: nosniff This is an HTTP response header
# feature that helps prevent attacks based on MIME-type confusion.

secure_content_security_policy="script-src 'self' 'unsafe-inline' 'unsafe-eval' *.googletagmanager.com *.doubleclick.net data:;img-src 'self' *.doubleclick.net http://*.tile.osm.org *.tile.osm.org *.gstatic.com data:;sty
```

```
le-src 'self' 'unsafe-inline' fonts.googleapis.com;connect-src 'self' *.google-analytics.com;frame-src *;child-src 'self' data: *.vimeo.com;object-src 'none'"
```

3. Click Save Changes.
4. Restart the Hue service.

Setting Oozie permissions

You can control access to the Oozie dashboard and editor by using controls in the Hue Web UI.

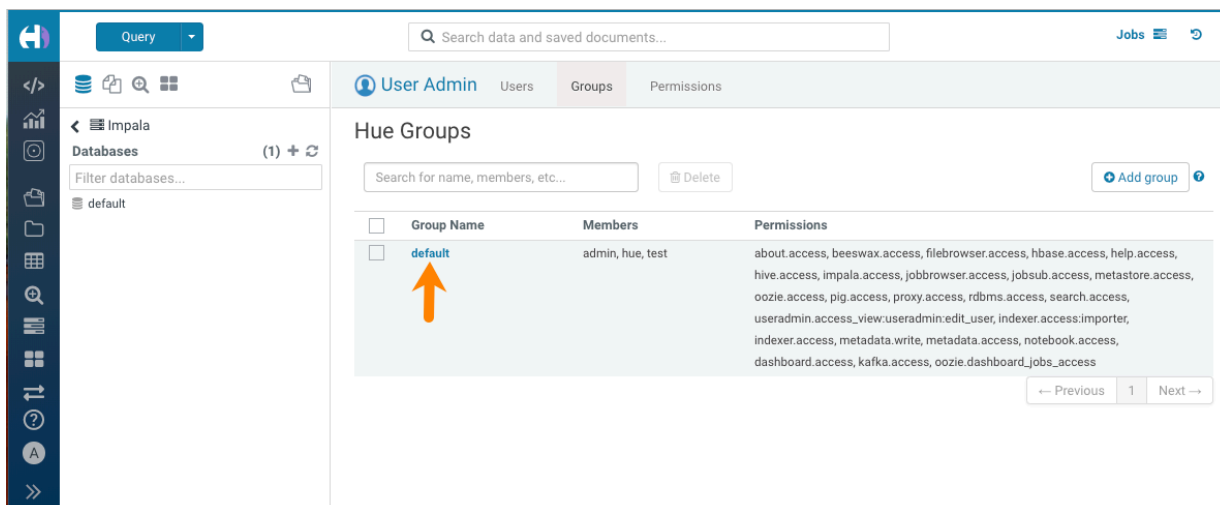

1. On the Cloudera Manager home page, click the Hue service.
2. On the Hue service page, select Web UIHue Load Balanced - recommended .
3. Log in to the Hue Web UI.
4. In the Hue Web UI, click the admin menu icon in the lower part of the left menu and select Manage Users:

The screenshot shows the Hue Web UI interface. The left sidebar contains a vertical menu of icons. An orange arrow points to the 'Admin' icon (a circle with the letter 'A'). The main content area shows the 'Impala' dashboard with a query editor and a table of saved queries.

Name	Description
Sample: Job loss	Job loss among the top earners 2007-08
Sample: Salary growth	Salary growth (sorted) from 2007-08
Sample: Top salary	Top salary 2007 above \$100k

5. On the User Admin page, click the Groups tab.

6. On the Hue Groups page, in the Group Name column, click the default group.

7. On the Hue Groups - Edit group page, scroll down to locate the list of permissions and then scroll further to locate the Oozie permissions:

Groups property in UI	Description
oozie.disable_editor_access	Disables access to the Oozie editor for the selected groups Default setting: Unchecked, which disables this permission.
oozie.access	Enables access to the Oozie editor in Hue. Default setting: Checked, which enables access to the Oozie editor.
oozie.dashboard_jobs_access	Enables read-only access for all jobs in the Oozie dashboard. Default setting: Check, which enables this permission.

8. Check or uncheck the permissions as needed and then click Update group to save the permission change.

Configuring secure access between Solr and Hue

If you are using Solr (search) to build dynamic search dashboards and explore data from the Hue web UI, and have secured your CDP cluster using Kerberos, then you must enable secure access between the Solr service and Hue by turning on the `security_enabled` parameter in the `hue_safety_valve.ini` file.

About this task

The `security_enabled` parameter is set to false, by default. To enable secure access between Solr and Hue:

Procedure

1. Sign in to Cloudera Manager as an Administrator.
2. Go to Clusters Hue service Configuration and search for the Hue Service Advanced Configuration Snippet (Safety Valve) for `hue_safety_valve.ini` field.
3. Go to the [search] section and set the value of the `security_enabled` parameter to true, as shown in the following sample:

```
[search]
# Requires FQDN in solr_url if enabled
security_enabled=true
# URL of the Solr Server
solr_url=http://[***FQDN-SOLR-HOST***]:8983/solr
```

Note: If you set `security_enabled=true`, then you must provide the fully-qualified domain name of the Solr host in the Solr URL.

4. Click Save Changes.
5. Restart the Hue service.
