# Overview

This guide provides information for administrators about useful maintenance tasks after a new installation of CDP Private Cloud Data Services on the Embedded Container Services (ECS).

## CDP Private Cloud Data Services Architecture

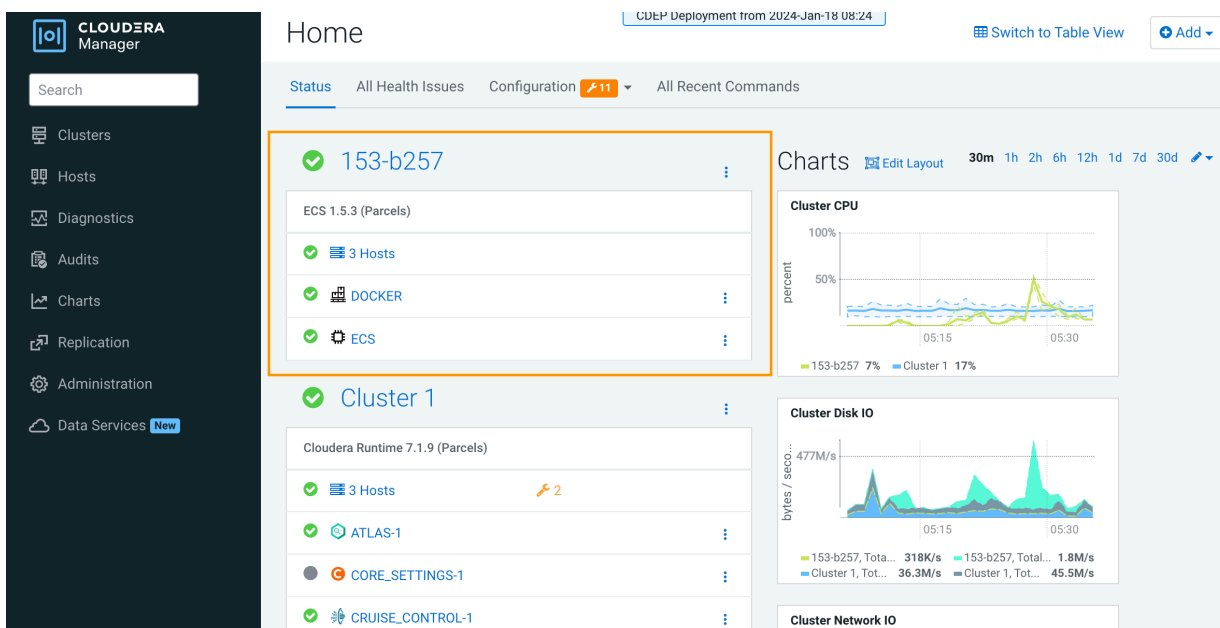

# Prerequisites

Perform the following steps to get started with ECS and the kubectl command line tool.

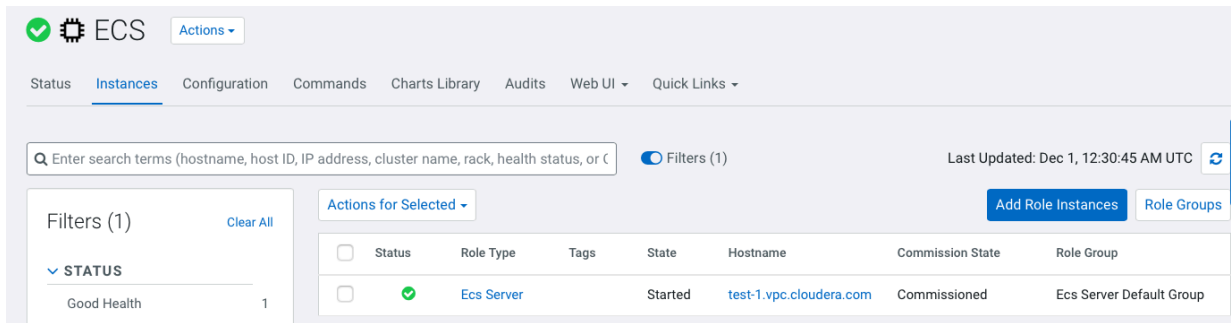

## Getting started

- In Cloudera Manager, confirm that the ECS Cluster is healthy:

- Identify the ECS server host. Click ECS in the ECS cluster, then click Instances. The ECS server host is listed in the Hostname column for the Ecs Server role type.

The screenshot shows the ECS console interface. At the top, there's a search bar and a 'Filters (1)' button. Below that, a table lists instances. The table has columns for Status, Role Type, Tags, State, Hostname, Commission State, and Role Group. One instance is listed with a green checkmark in the Status column, 'Ecs Server' in the Role Type column, 'Started' in the State column, and 'test-1.vpc.cloudera.com' in the Hostname column.

Status	Role Type	Tags	State	Hostname	Commission State	Role Group
<input checked="" type="checkbox"/>	Ecs Server		Started	test-1.vpc.cloudera.com	Commissioned	Ecs Server Default Group

- Open a connection to the ECS server host:

```
ssh test-1.vpc.cloudera.com
```

Ensure that you are using the root user:

```
root@test-1 ~]# whoami
root
```

### Set up Kubernetes and kubectl

You can use the kubectl command line tool to interact with Kubernetes.

- Cluster management – kubectl allows you to manage various aspects of Kubernetes clusters, including deploying applications, inspecting and managing cluster resources, and viewing logs.
- Interacting with nodes and pods – kubectl provides commands to interact with and manage nodes, pods, and other resources within a Kubernetes cluster.
- Deployment and application management – You can use kubectl to create, update, and delete applications running on Kubernetes, as well as control scaling and rollout of updates.
- Debugging and diagnostics – kubectl includes various commands for checking the health of resources, diagnosing issues, and accessing logs.

To set up Kubernetes configuration and the kubectl alias, add the following lines to your bash profile. This eliminates the need to set this up for each session.

```
KUBECONFIG=/etc/rancher/rke2/rke2.yaml
alias kubectl=/var/lib/rancher/rke2/bin/kubectl
```

## Basic operations

This topic describes a few basic kubectl command line tool operations.

### View kubeconfig settings

```
[root@test-1 ~]# kubectl config view
apiVersion: v1
clusters:
- cluster:
  certificate-authority-data: DATA+OMITTED
  server: https://127.0.0.1:6443
  name: default
contexts:
```

```
- context:
  cluster: default
  user: default
  name: default
current-context: default
kind: Config
preferences: {}
users:
- name: default
  user:
    client-certificate-data: REDACTED
    client-key-data: REDACTED
```

### Get all nodes in the Kubernetes environment

```
[root@test-1 ~]# kubectl get nodes
NAME                                STATUS    ROLES                                AGE      VERSION
test-1.vpc.cloudera.com            Ready    control-plane,etcd,master           2d4h    v1.25.14+rke2r1
test-2.vpc.cloudera.com            Ready    <none>                               2d4h    v1.25.14+rke2r1
```

### Get all namespaces

```
[root@test-1 ~]# kubectl get namespaces
NAME                                STATUS    AGE
cdp                                  Active   2d4h
cdp-drs                              Active   2d4h
cdp-services                         Active   2d4h
default                              Active   2d4h
ecs-webhooks                         Active   2d4h
infra-prometheus                    Active   2d4h
k8tz                                  Active   2d4h
kube-node-lease                     Active   2d4h
kube-public                          Active   2d4h
kube-system                          Active   2d4h
kubernetes-dashboard                Active   2d4h
liftie-wjtnjzm-ns                   Active   2d4h
local-path-storage                  Active   2d4h
longhorn-system                     Active   2d4h
observability                        Active   2d4h
pod-reaper                           Active   2d4h
test-1-5ea742bf-monitoring-platform Active   2d4h
vault-system                         Active   2d4h
yunikorn                             Active   2d4h
```

### Check all pods in a namespace

Use the following command format to check all pods in a namespace:

```
kubectl get pods -n <namespace_name>
```

For example, to get the pods and their status in the vault-system namespace:

```
[root@test-1 ~]# kubectl get pods -n vault-system
NAME                                READY    STATUS
helm-install-vault-pd842            0/1     Completed
                                0       2d6h
```

```
vault-0                                1/1                                Running
    0                                  2d6h
vault-exporter-84bd8f848d-s9grm        1/1                                Running
    0                                  2d6h
```

### Get the containers in a pod

Use the following command format to get the containers in a pod:

```
root@test-1 ~]# kubectl get pods -n <namespace_name> <pod_name> -o=jsonpath=
' {.spec.containers[*].name} '
```

For example, to get the containers in the fluentd-aggregator-0 pod in the cdp namespace:

```
root@test-1 ~]# kubectl get pods -n cdp fluentd-aggregator-0 -o=jsonpath='{
.spec.containers[*].name}'
thunderhead-diagnostics-api
fluentd-aggregator[
```

### Get logs from a specific pod

Use the following command format to get logs from a specific pod:

```
kubectl logs -n <namespace_name> <pod_name>
```

For example, to get the logs from the vault-0 pod in the vault-system namespace:

```
[root@test-1 ~]# kubectl logs -n vault-system vault-0
==> Vault server configuration:

    Api Address: https://10.42.0.15:8200
        Cgo: disabled
    Cluster Address: https://vault-0.vault-internal:8201
    Environment Variables: GODEBUG, HOME, HOSTNAME, HOST_IP, KUBERNETES_POR
T,
KUBERNETES_PORT_443_TCP, KUBERNETES_PORT_443_TCP_ADDR,
KUBERNETES_PORT_443_TCP_PORT, KUBERNETES_PORT_443_TCP_PROTO,

==> Vault server started! Log data will stream in below:
2023-11-28T20:34:33.998Z [INFO] proxy environment: http_proxy="" https_pro
xy="" no_proxy=""
```

```

2023-11-28T20:34:33.998Z [INFO] core: Initializing version history cache
for core
2023-11-28T20:34:36.013Z [INFO] core: security barrier not initialized
2023-11-28T20:34:36.014Z [INFO] core: seal configuration missing, not init
ialized
2023-11-28T20:34:36.014Z [INFO] core: security barrier not initialized
2023-11-28T20:34:36.015Z [INFO] core: security barrier initialized: stored=
1 shares=1 threshold=1
2023-11-28T20:34:36.016Z [INFO] core: post-unseal setup starting
2023-11-28T20:34:36.029Z [INFO] core: loaded wrapping token key

```

### Get logs from a specific container

To get the logs from a specific container, use the following command format:

```
kubectl logs -n <namespace_name> <pod_name> -c container_name
```

For example, the following command lists all of the containers:

```
kubectl get pods cdp-release-thunderhead-environment-85bdfdb466-gprcb -n e2e
-djwl0v -o jsonpath='{.spec.containers[*].name}'
thunderhead-environment fluentbit
```

Then the `kubectl logs` command can be used with the `-c` option to return the logs from the `thunderhead-environment` container:

```
kubectl logs cdp-release-thunderhead-environment-85bdfdb466-gprcb -c thunder
head-environment -n e2e-djwl0v
```

### Tunnel into a container

The following example demonstrates how to tunnel into one of the containers above, and then execute a list command:

```

[root@test-1 ~]# kubectl -n cdp exec -it pod/fluentd-aggregator-0 -c fluentd
-aggregator -- bash
[cloudera@fluentd-aggregator-0 /]$ ls -lrth
total 152K
drwxr-xr-x  2 root root    6 Dec 14  2017 srv

```

## Collecting diagnostic data

You can collect diagnostic data using the kubectl command line tool, or by downloading diagnostic data bundles.

### Using kubectl to collect logs

You can use the following kubectl commands to collect log files:

```
alias kubectl='/var/lib/rancher/rke2/bin/kubectl --kubeconfig /etc/rancher/rke2/rke2.yaml'

kubectl get pods -A -o wide --kubeconfig /etc/rancher/rke2/rke2.yaml > /tmp/pods_status_all.txt
echo "+++PODS cdp+++" >> /tmp/pods_status.txt
kubectl -n cdp get pods --kubeconfig /etc/rancher/rke2/rke2.yaml >> /tmp/pods_status.txt
echo "+++PODS kubernetes-dashboard+++" >> /tmp/pods_status.txt
kubectl -n kubernetes-dashboard get pods >> /tmp/pods.txt

echo "+++EVENTS +++" >> /tmp/pods_status_all.txt
kubectl get event -n kubernetes-dashboard >> /tmp/pods.txt

kubectl get pods -A | grep -vai 'running' | grep -vai 'completed'
```

If you see issues with a specific pod, collect the following:

```
kubectl logs <POD_NAME> -n <Namespace> --all-containers=true
kubectl describe pod <POD_NAME> -n <Namespace>
kubectl get events -n <Namespace>
```

### Downloading ECS cluster diagnostic data

1. In Cloudera Manager, click Support, then click Send Diagnostic Data.

The screenshot shows the Cloudera Manager interface. On the left is a dark sidebar with navigation options: Clusters, Hosts, Diagnostics, Audits, Charts, Replication, Administration, and Data Services (marked as 'New'). The 'Support' option is highlighted with an orange box. A dropdown menu is open from 'Support', with 'Send Diagnostic Data' also highlighted in orange. Other items in the menu include Support Tokens, Support Portal, Scheduled Diagnostics: Weekly, Help, Installation Guide, Upgrade Guide, API Documentation, API Explorer, Release Notes, and About. The main content area shows a 'Home' page for a 'CDEP Deployment from 2024-Jan-25 11:12'. It features a 'Status' bar with tabs for 'All Health Issues', 'Configuration' (with a wrench icon and '11'), and 'All Recent Commands'. Below this, there are two main sections: '153-b264' and 'Cluster 1'. The '153-b264' section lists components like ECS 1.5.3 (Parcels) with 3 Hosts, DOCKER, and ECS. The 'Cluster 1' section lists Cloudera Runtime 7.1.9 (Parcels) with 3 Hosts, ATLAS-1, CORE\_SETTINGS-1, CRUISE\_CONTROL-1, and HBASE-1. A 'Send Diagnostic Data' button is visible next to the HBASE-1 host. On the right side, there are several performance charts: 'Cluster CPU' (percent), 'Cluster Disk IO' (bytes/sec), 'Cluster Network IO' (bytes/sec), 'HDFS IO' (bytes/second), and 'Completed Impala Queries' (queries/second). The CPU chart shows 153-b264 at 5.4% and Cluster 1 at 6%. The Disk IO chart shows 153-b264 at 19.5K/s and Cluster 1 at 8.5M/s. The Network IO chart shows 153-b264 at 1.1M/s and Cluster 1 at 317K/s. The HDFS IO chart shows 153-b264 at 19.5K/s and Cluster 1 at 27.7K/s.

2. On the Send Diagnostic Data pop-up, select **Collect Diagnostic Data only**, then click **Collect Diagnostic Data**.

**Send Diagnostic Data** ✕

Collected data includes metadata, configurations, and log data from all roles running on all nodes in the cluster. Passwords are not collected. All data is collected in accordance with the Cloudera [Privacy and Data Policies](#). For more information about data collection, please refer to this [documentation](#).

Collect and Upload Diagnostic Data to Cloudera Support  
 **Collect Diagnostic Data only**  
⚠ Requires manual download and attachment to Cloudera Support Case.

---

Case Number   
If you have a Cloudera support ticket number for the issue being experienced on the cluster, enter it here.

System Identifier **default**  
This may be configured in the Cloudera Manager Settings.

Cluster name

> **Restrict log and metrics collection**

**Data Selection**

By Target Size  By Date Range

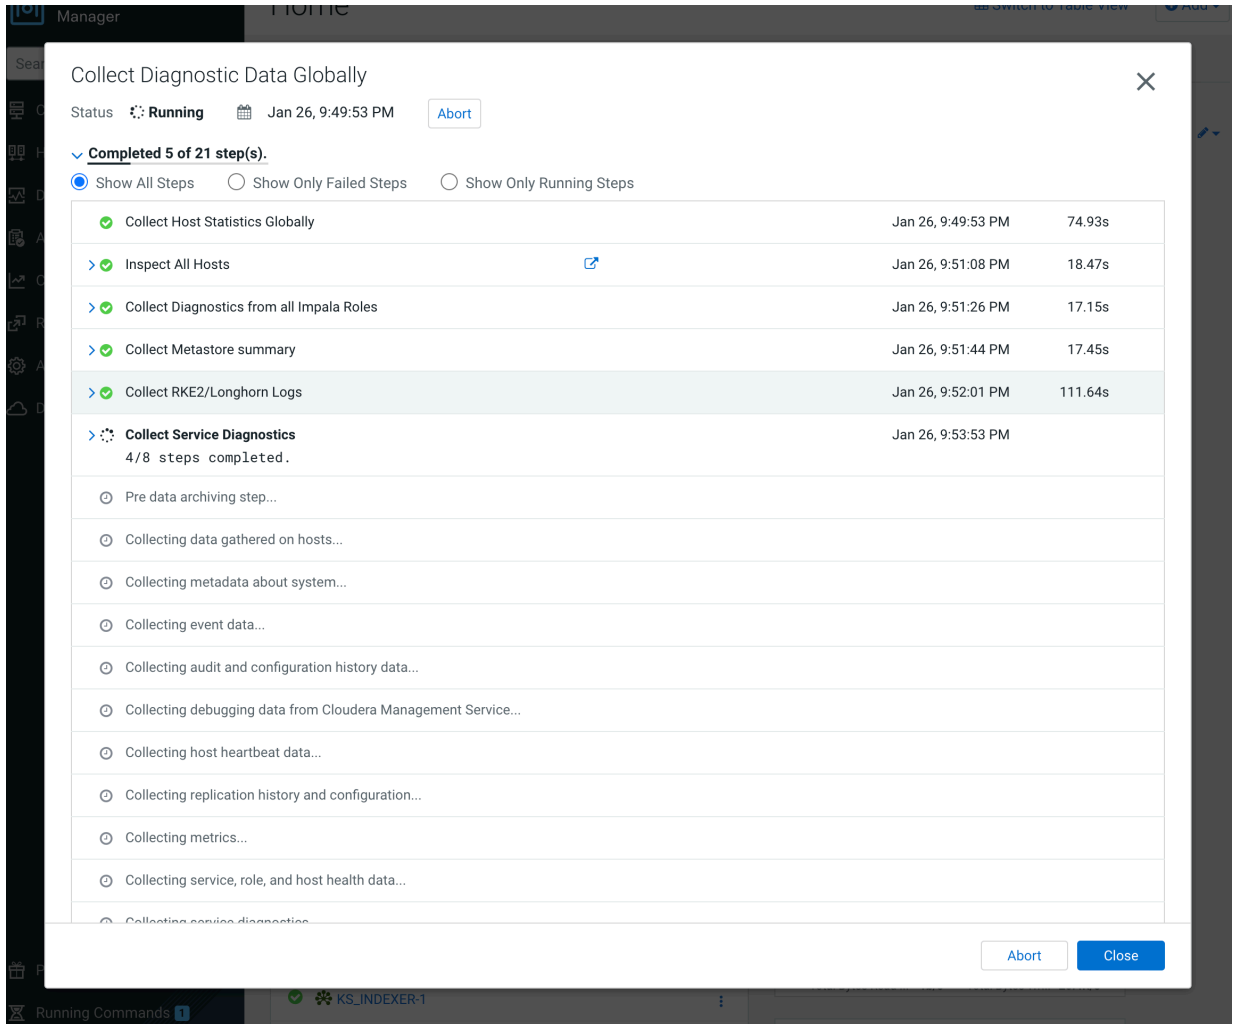

End Time  UTC  
End time for log collection. Pre-populated from the Time Range Selector.

Target Maximum Size  MB  
Approximate size of diagnostic data bundle, which contains data for all hosts. Most bundles will not be larger than this size, and some will be smaller due to a lack of data or to compression.

Include Cloudera  Yes

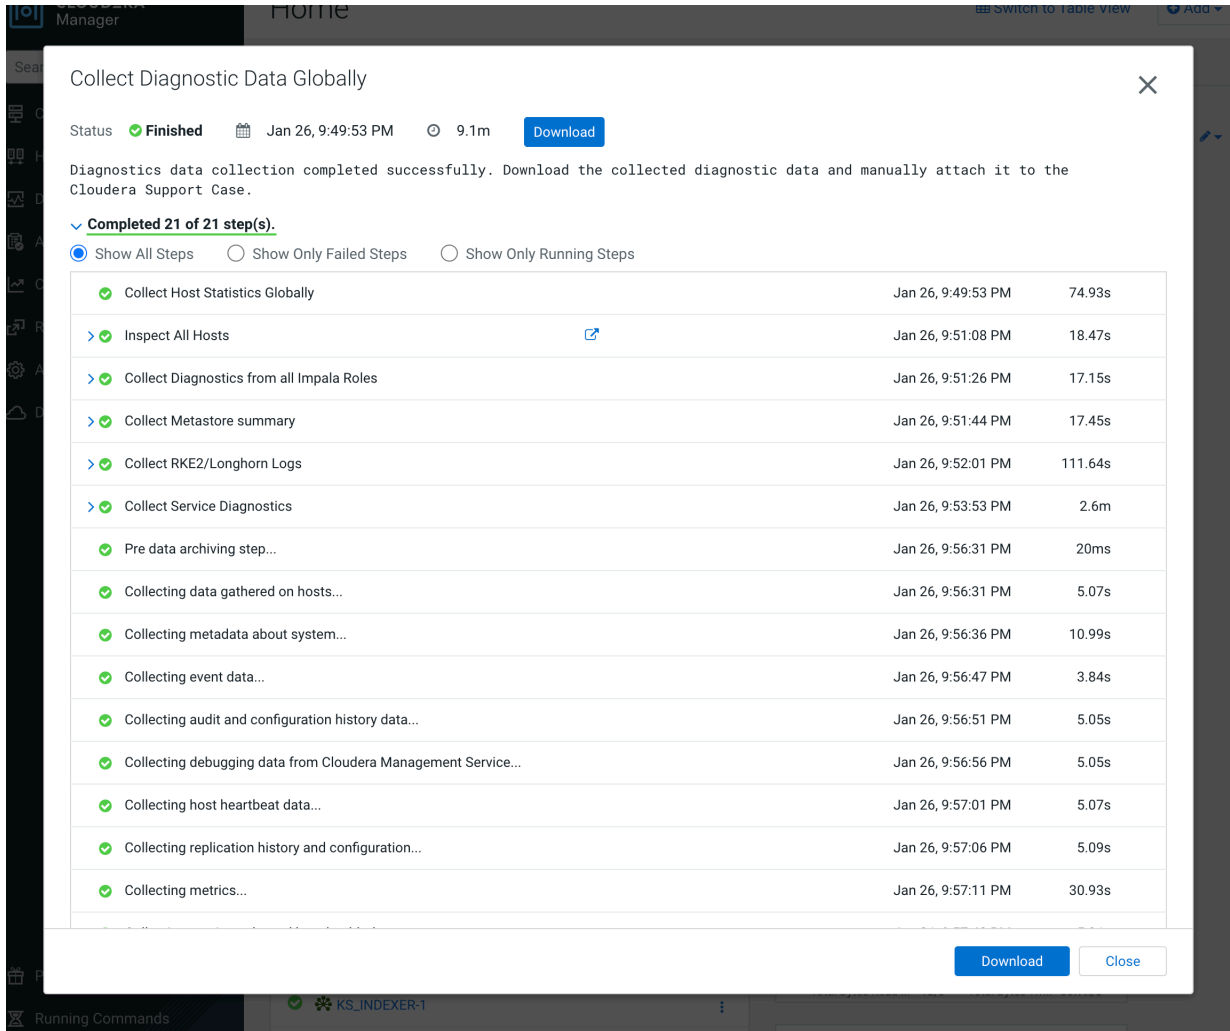

Cancel **Collect Diagnostic Data**

3. The Collect Diagnostic Data Globally pop-up displays the data collection progress.

- When the data collection process is complete, click **Download** to download the ECS cluster diagnostic data.

Collect Diagnostic Data Globally

Status ✔ **Finished** 📅 Jan 26, 9:49:53 PM ⌚ 9.1m Download

Diagnostics data collection completed successfully. Download the collected diagnostic data and manually attach it to the Cloudera Support Case.

✔ **Completed 21 of 21 step(s).**

Show All Steps  Show Only Failed Steps  Show Only Running Steps

### Downloading a Longhorn storage support bundle

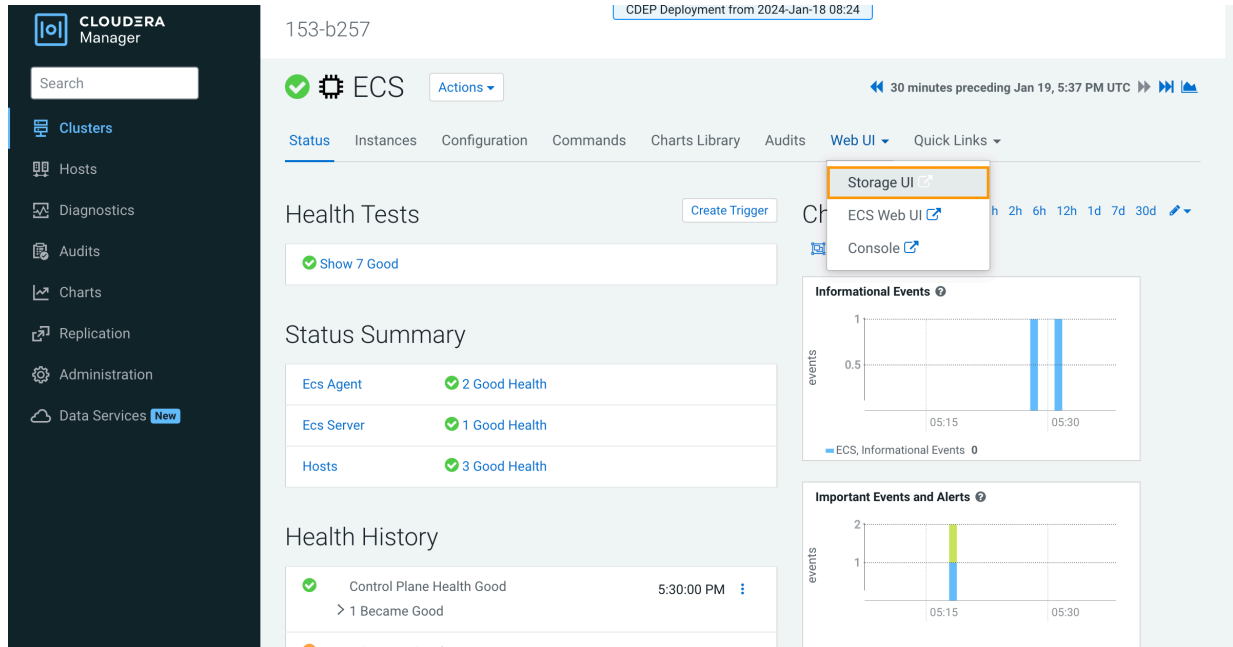

For suspected storage issues, you can use the ECS Storage UI to download a Longhorn support bundle.

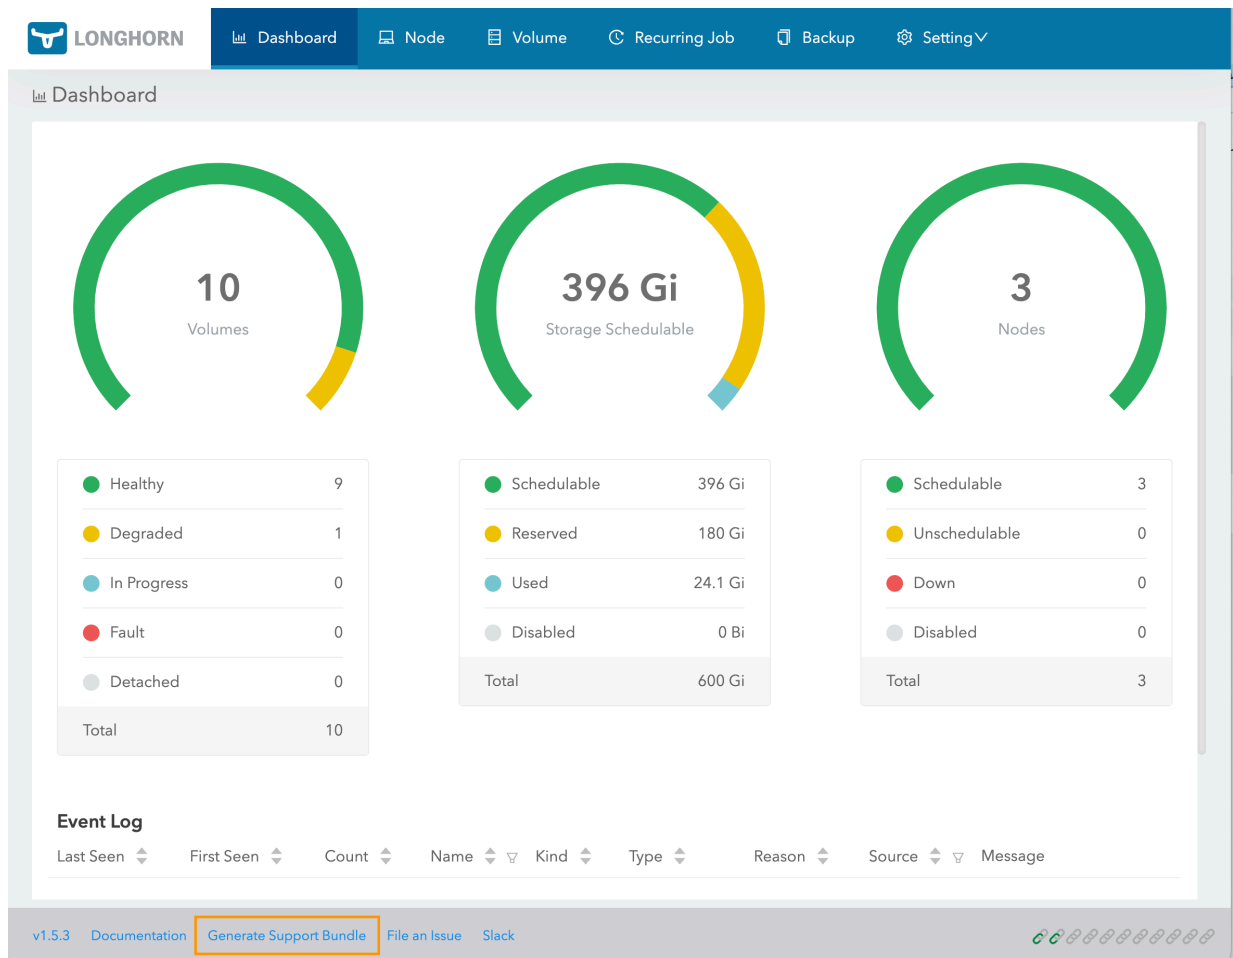

**Note:**

The Longhorn bundle is included in the Cloudera Manager bundle. If you have already collected the Cloudera Manager bundle, there is no need to download the Longhorn bundle. Also, if the Longhorn UI is down, you can collect the Cloudera Manager bundle as an alternative.

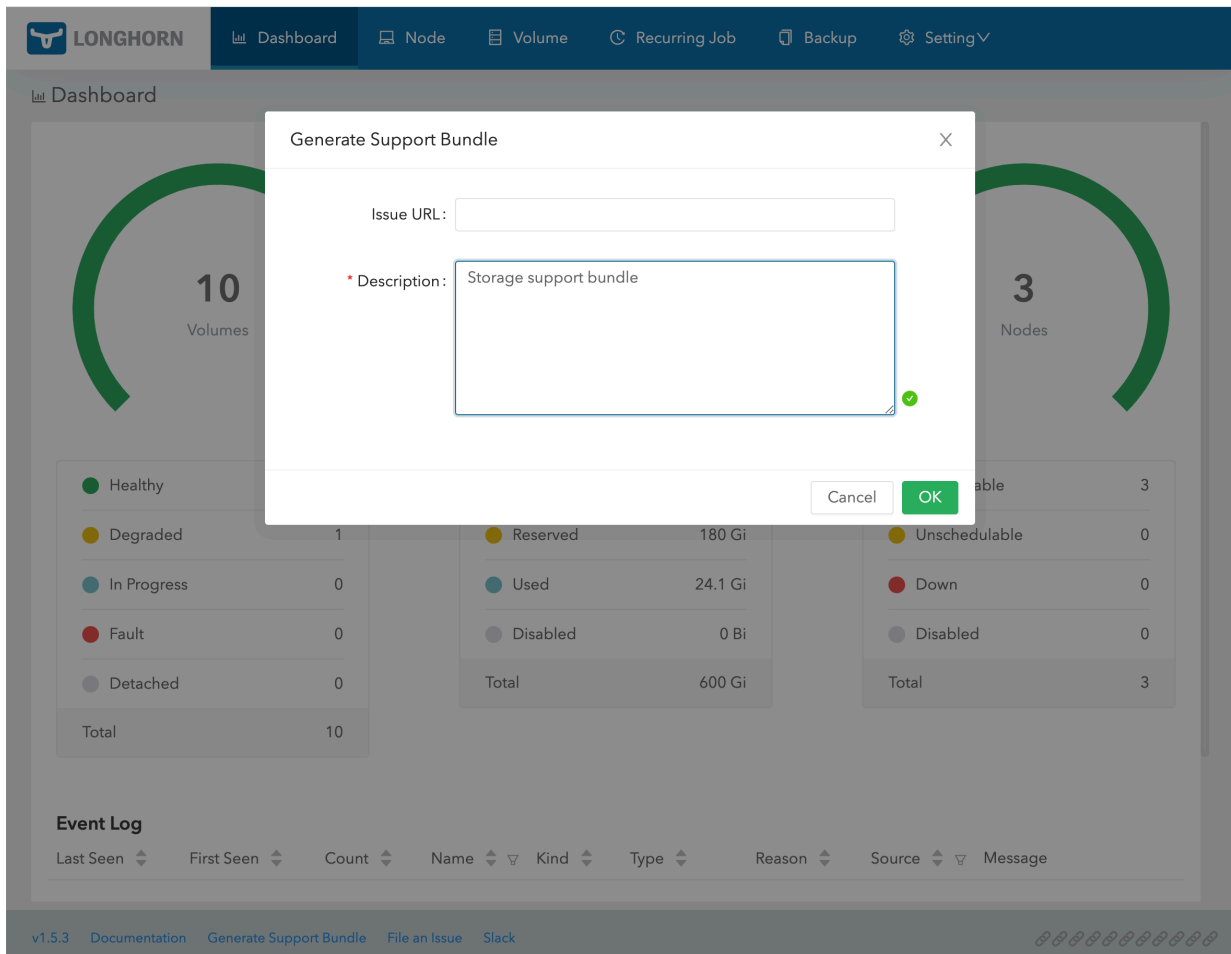

1. In Cloudera Manager, click ECS, then select Web UI > Storage UI.

2. Click Generate Support Bundle at the bottom of the Longhorn storage UI.

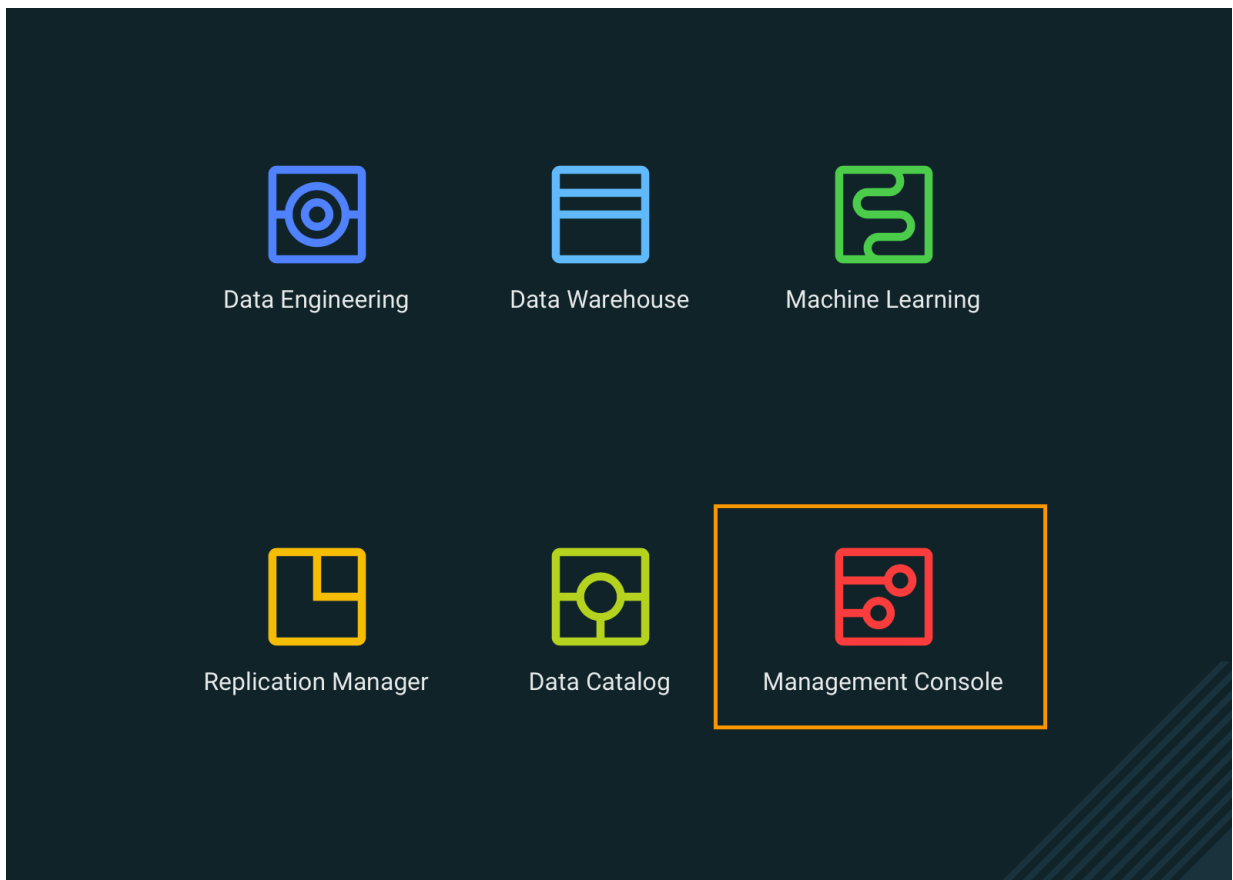

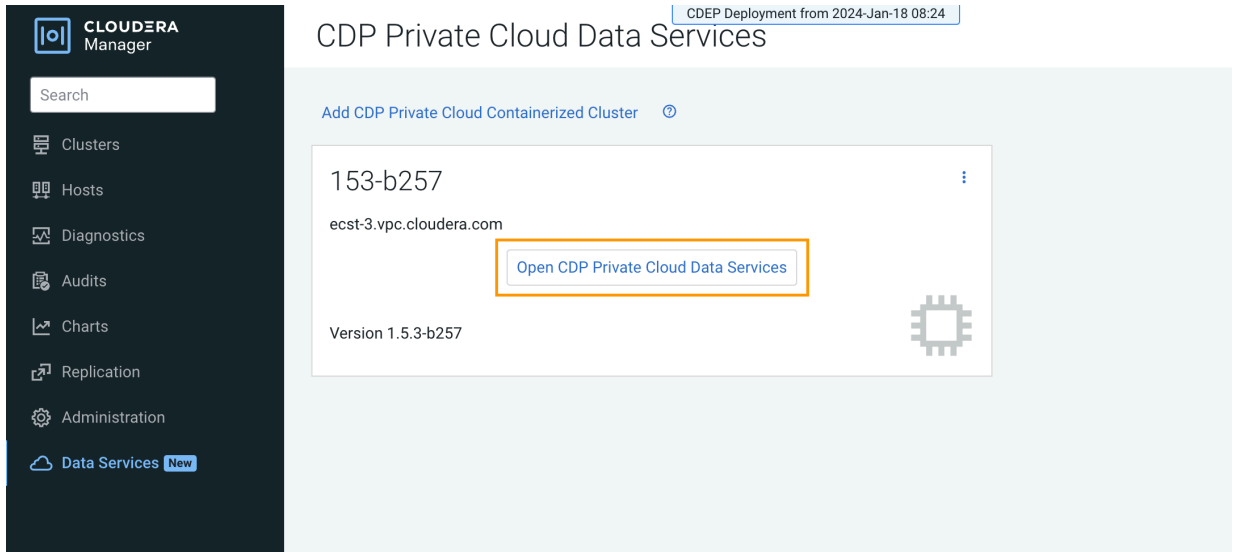

3. On the Generate Support Bundle pop-up, enter a description (Issue URL is optional), then click OK to download the Longhorn storage support bundle.

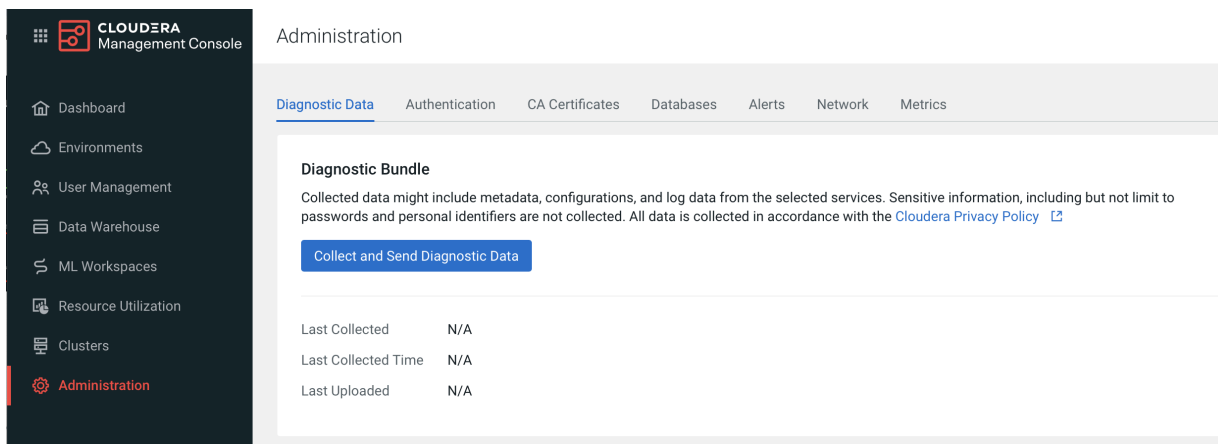

### Downloading CDP Private Cloud diagnostic data

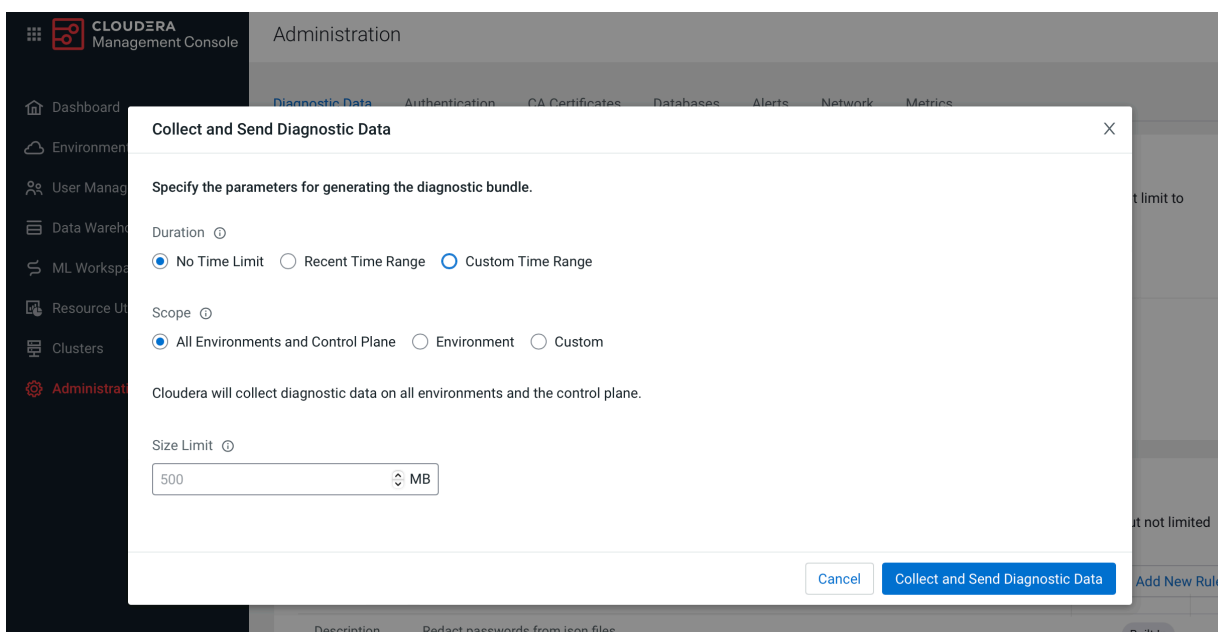

1. To access the Management Console, click Data Services in Cloudera Manager, then click Open CDP Private Cloud Data Services, and then select Management Console.

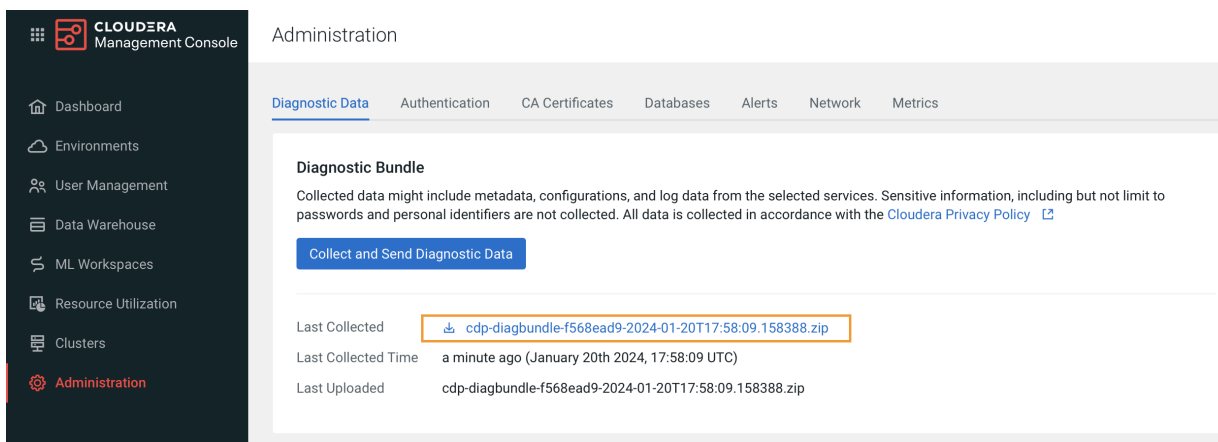

- To download a diagnostic bundle, click Administration, then click Collect and Send Diagnostic Data.

- On the Collect and Send Diagnostic Data pop-up, specify the duration, scope, and a size limit for the data, then click Collect and Send Diagnostic Data.

- When the data collection process is complete, the .zip download file appears on the Diagnostic Data page.

## Proactive monitoring

You can define alert rules for your CDP Private Cloud Data Services deployment based on [PromQL](#) expressions. The alerts are automatically triggered when specific events occur in your deployment. You can view the triggered alerts on the Management Console dashboard. Any alert receivers that you have already configured start sending notifications to specified endpoints.

## Configuring alert rules

1. To access the Management Console, click Data Services in Cloudera Manager, then click Open CDP Private Cloud Data Services, and then select Management Console.

2. On the Management Console home page, select Administration > Alerts.

### 3. On the Alerts page, click Add Alert Rule.

The screenshot shows the Cloudera Management Console Administration page. The left sidebar contains navigation options: Dashboard, Environments, User Management, Data Warehouse, ML Workspaces, Resource Utilization, Clusters, and Administration (highlighted in red). The main content area is titled 'Administration' and includes tabs for Diagnostic Data, Authentication, CA Certificates, Databases, Alerts (selected), Network, and Metrics. Under the 'Alerts' tab, there are two sections: 'Alert Receivers' and 'Alerting Rules'. The 'Alerting Rules' section includes a search bar, a table of existing rules, and an 'Add Alert Rule' button highlighted with a red box.

Status	Name	Severity	Alert Scope
Enabled	Built In AlertAdministrationBuiltInRuleLoadingFailed	critical	Control Plane
Enabled	Built In AlertAdministrationCmlImportFailed	warning	Control Plane
Enabled	Built In AlertAdministrationConfigurationFailed	critical	Control Plane
Enabled	Built In AlertAdministrationTopologyStreamReceiveFailedRatioHigh	warning	Control Plane
Enabled	Built In AlertManagerConfigurationDurationHigh	warning	Control Plane
Enabled	Built In AlertRuleConfigurationDurationHigh	warning	Control Plane

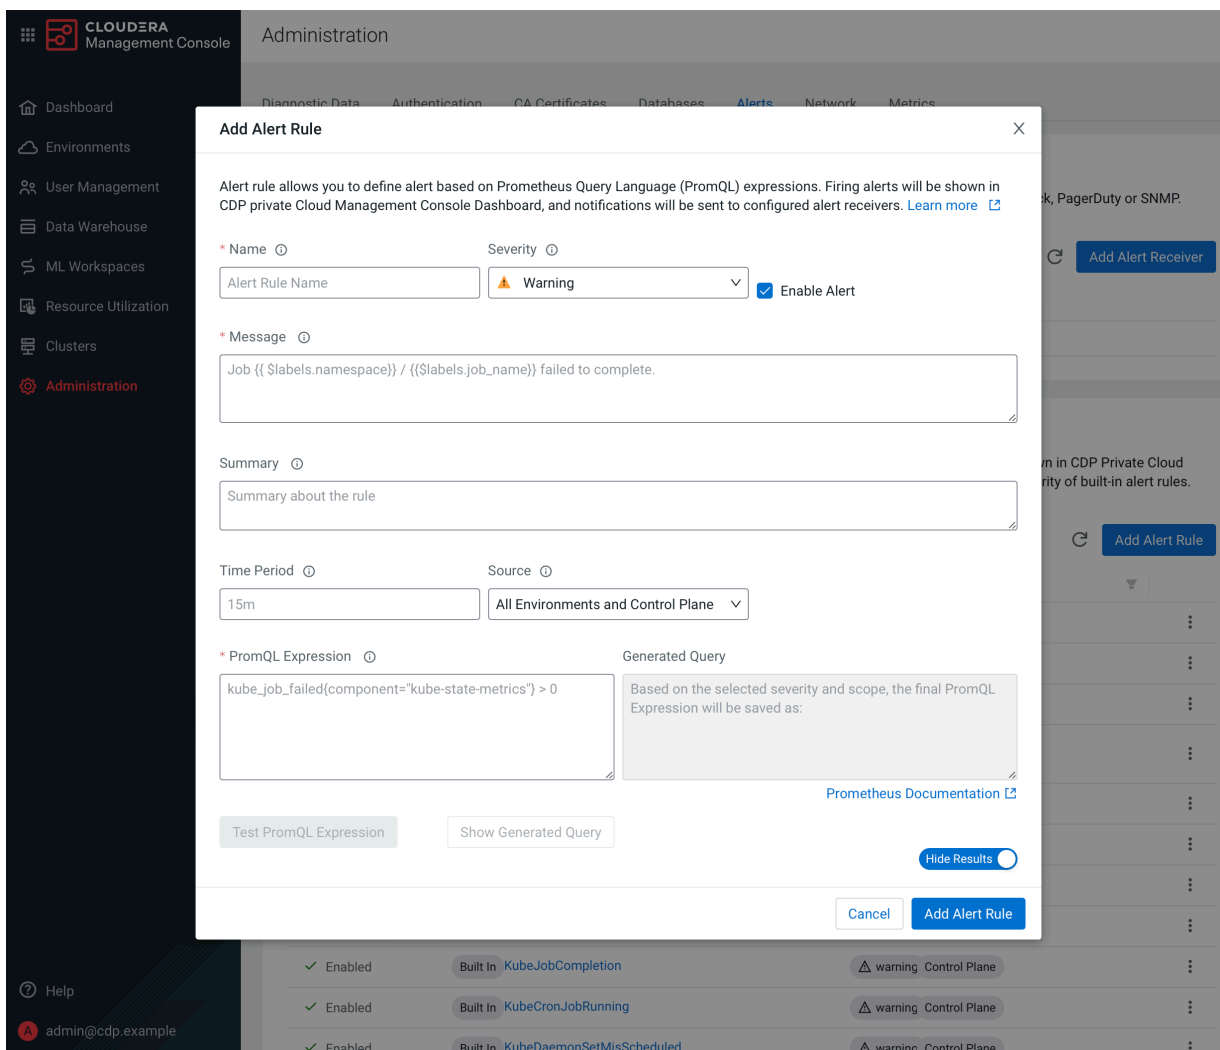

### 4. On the Add Alert Rule pop-up, enter the following alert rule options (required fields are indicated in bold) then click Add Alert Rule.

Field	Description
Name	The name of the alert rule. You cannot use spaces or special characters in the name.
Severity	Specify the severity: Critical or Warning.
Enable Alert	Select this checkbox to enable the alert rule.
Message	The alert rule text. You can use PromQL labels to denote entities such as jobs in the text. For more information about using PromQL labels, see <a href="#">Alerting Rules</a> .
Summary	A brief summary of the alert rule.
Time Period	The duration for which the PromQL expression must be true. If the expression continues to be true after the specified duration, the configured alert is automatically triggered.
Source	The CDP Private Cloud components for which the alert rule applies. You can select one of the following options as the source: <ul style="list-style-type: none"> <li>All Environments and Control Plane</li> <li>Environments</li> <li>Control Plane</li> <li>A specific environment from the list of configured environments</li> </ul>

Field	Description
PromQL Expression	<p>The query expression in PromQL. The alert is issued when this expression is true for the time period specified in the For Clause.</p> <p> <b>Important:</b> Metrics reported by the environments always contain the following labels: <code>appId</code> and <code>appName</code>. Therefore, the result of the alert rule's query expression also must contain these labels. To ensure that the result contains the labels, include the <code>by (appId, appName)</code> clause when using aggregation operators in the query expression. For example, instead of the <code>count(my_metric) &gt; 0</code> expression, use the <code>count(my_metric) by (appId, appName) &gt; 0</code> expression.</p>
Generated Query	<p>The query that is generated for a selected workload type depending on the specified PromQL expression.</p> <p>You can view the query by clicking Show Generated Query.</p>

Field	Description
Test PromQL Expression	<p>You can click this option to test the query expression generated for the combination of a selected source and workload type.</p> <p>If you select one of All Environments and Control Plane, Environments, or Control Plane as the source for the PromQL query, it runs <i>only</i> on the control plane. To run the query on an environment, you must select a specific environment as the source.</p> <p> <b>Note:</b> If you click this option <i>before</i> saving the alert rule and if the PromQL expression is invalid, an unexpected error appears. In addition, you may lose all of the information entered for configuring the alert rule. Therefore, you should save the alert rule and then test the PromQL expression.</p>

The new alert rule is listed on the Alerts page under Alerting Rules.

## Environment health checks

You can use environment health checks to verify the health of various ECS components. If you are experiencing issues, these tests can help you diagnose and solve the problem.

## Host health checks

### Check the status of all nodes in the Kubernetes environment

```
[root@test-1 ~]# kubectl get nodes
NAME                                STATUS    ROLES                                AGE     VER
test-1.vpc.cloudera.com            Ready    control-plane,etcd,master          2d4h    v1.25
.14+rke2r1
test-2.vpc.cloudera.com            Ready    <none>                             2d4h    v1.
25.14+rke2r1
```

### Ensure that the namespaces are all active

```
[root@test-1 ~]# kubectl get namespaces
NAME                                STATUS    AGE
cdp                                  Active   2d4h
cdp-drs                              Active   2d4h
cdp-services                         Active   2d4h
default                              Active   2d4h

longhorn-system                    Active   2d4h
observability                      Active   2d4h
pod-reaper                         Active   2d4h
test-1-5ea742bf-monitoring-platform Active   2d4h
vault-system                       Active   2d4h
yunikorn                           Active   2d4h
```

## Vault health checks

### Vault states

There are three possible states the Vault can be in:

- Initialization:

This involves preparing the Vault's storage back end to accept data. This cannot be executed on a Vault cluster that has already been initialized. The Vault operates with a self-signed certificate, and the `ecs_util.sh` script encompasses all of the necessary steps for this process.

- Unsealing:

If the Vault is resealed, restarted, or stopped, a minimum of three keys are required to unseal it to resume request handling. The Vault does not retain the generated root key, as the root key must be reconstructed using at least three keys, or the vault remains permanently sealed. Cloudera stores the root key in Cloudera Manager, and this is the key that is used when the unseal option is selected from the Cloudera Manager user interface.

- Startup:

After completing initialization and unsealing, the Vault is ready to be started. Once operational, it can begin processing requests.

### Check the Vault status

```
[root@test-1 ~]# kubectl get pods -n vault-system
NAME                                READY   STATUS    RESTARTS
AGE
helm-install-vault-pd842            0/1     Completed 0
2d6h
vault-0                              1/1     Running   0
2d6h
vault-exporter-84bd8f848d-s9grm    1/1     Running   0
2d6h
```

### Unseal the Vault using Cloudera Manager

You should only unseal the Vault if there are issues reported in the logs about the Vault being sealed, or if pods in the Vault namespace are crash-looping.

To unseal the Vault, select the ECS cluster in Cloudera Manager, click ECS, then select Actions > Unseal Vault.

The screenshot shows the Cloudera Manager interface for an ECS cluster. The 'Actions' dropdown menu is open, displaying various options. The 'Unseal Vault' option is highlighted, and a tooltip message is visible: "Unseal Vault in ECS after Vault component restart." The background shows the ECS cluster page with sections for Health Tests, Status Summary, and Health History.

## Storage health checks

### Check storage mounts

```
[cloudera@fluentd-aggregator-0 /]$ mount | grep longhorn
```

```
/dev/longhorn/pvc-2f71ea50-744c-4eb9-875c-3f793d141961 on /var/log type ext4
(rw,relatime,data=ordered)
```

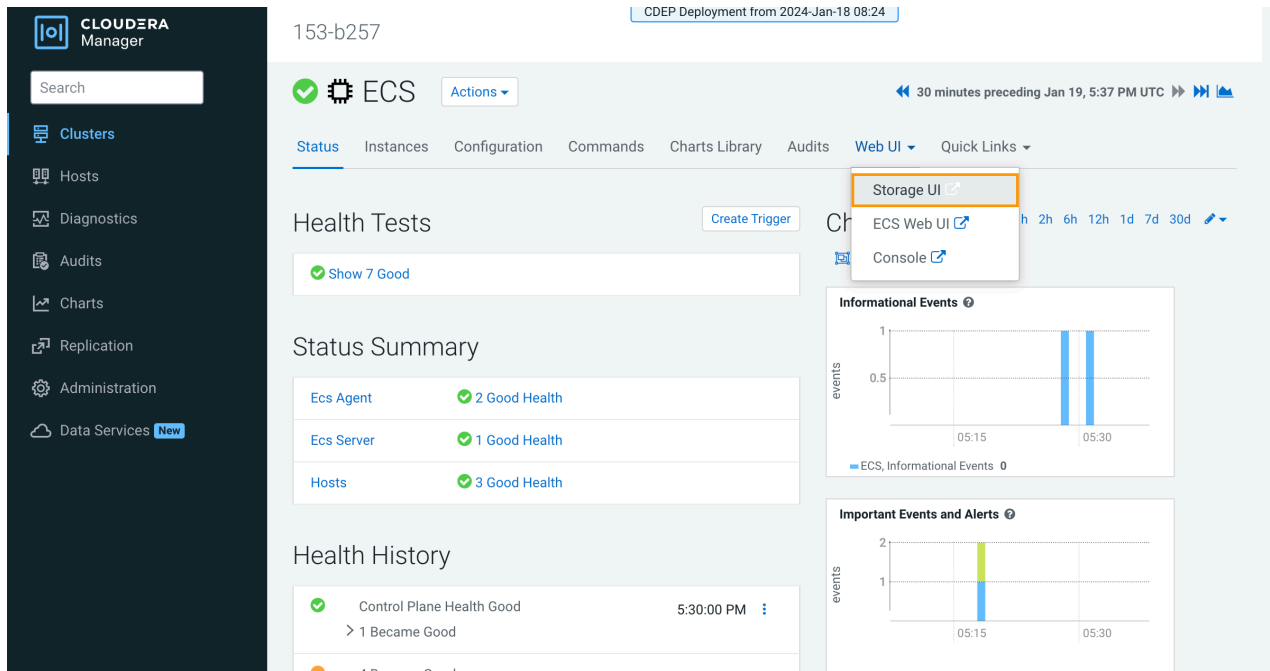

### Check Longhorn status

```
[root@test-1 ~]# kubectl get pods -n longhorn-system
NAME                                READY   STATUS    R
ESTARTS   AGE

longhorn-ui-79c96b46cb-4jqrq 2d10h	1 / 1	Running	0
longhorn-ui-79c96b46cb-fvn5g 2d10h	1 / 1	Running	0

### Check Longhorn status using the UI

In Cloudera Manager, click ECS, then select Web UI > Storage UI.

A healthy system should show healthy volumes, schedulable storage, and schedulable nodes:

```
msg="pvc-e930fca4-0c90-44b0-bedb-9d9d39ec197c-e-c87678d7: 2023/03/02 09:27:40
cannot create an available backend for the engine from the addresses
[tcp://10.42.0.21:10120]"
```

Checking the instance-manager pod logs, it shows a discrepancy between the actual and the expected volume size. The volume size has drifted from the requested pvc:

```
[pvc-e930fca4-0c90-44b0-bedb-9d9d39ec197c-r-57d7d0e6]
time="2023-03-03T01:48:08Z" level=info msg="Opening volume
/host/ecs/longhorn-storage/replicas/pvc-e930fca4-0c90-44b0-bedb-9d9d39ec197c-fb
bf1fa2, size 10737418240/512"

2023-01-30T14:59:53.514816555-08:00 stderr F
[pvc-84f1c799-284c-4676-9c3a-34a7fdcf8cc-e-3b7dabc9]
time="2023-01-30T22:59:53Z" level=warning msg="backend tcp://10.42.1.47:10000
size does not match 2147483648 != 64424509440 in the engine initiation phase"
```

This can be resolved by updating the volume size to the original expected size:

1. SSH into the node that has the replica.
2. cd into the replica folder, for example:

```
cd /longhorn/replicas/pvc-126d40e2-7bff-4679-a310-1a5dc941
```

3. Change the size field from its current value to the expected value in the volume.meta file.

## Host-level tasks

### Starting, stopping, restarting, and refreshing Embedded Container Service Clusters

Procedures to start, stop, restart, and refresh Private Cloud Experience clusters

#### Starting an Embedded Container Service Cluster

##### Procedure

1. On the HomeStatus tab, click the Actions Menu to the right of the Embedded Container Service cluster name and select Start.
2. Click the Start button that appears in the next screen to confirm. The Command Details window shows the progress of starting services.

##### Results

When the All services successfully started message appears, the task is complete and you can close the Command Details window.

#### Stopping a CDP Private Cloud Data Services Cluster

### Procedure

1. On the HomeStatus tab, click the Actions Menu to the right of the Embedded Container Service cluster name and select Stop.
2. Click the Stop button in the confirmation screen. The Command Details window shows the progress of stopping services.

### Results

When the All services successfully stopped message appears, the task is complete and you can close the Command Details window.

**Note:** The cluster-level Stop action does not stop the Cloudera Management Service. You must stop the Cloudera Management Service separately.

## Restarting a Embedded Container Service Cluster

### Procedure

1. On the HomeStatus tab, click the Actions Menu to the right of the cluster name and select Restart.
2. Click the Restart button that appears in the next screen to confirm.  
The Command Details window shows the progress of stopping services. When the All services successfully started message appears, the task is complete and you can close the Command Details window.
3. Click ActionsUnseal Vault

## Refreshing a Embedded Container Service Cluster

### Procedure

To refresh a cluster, in the HomeStatus tab, click the Actions Menu to the right of the cluster name and select Refresh Cluster.

## Adding hosts to a Embedded Container Service Cluster

You can add hosts to a Embedded Container Service (ECS) cluster to increase capacity and performance.

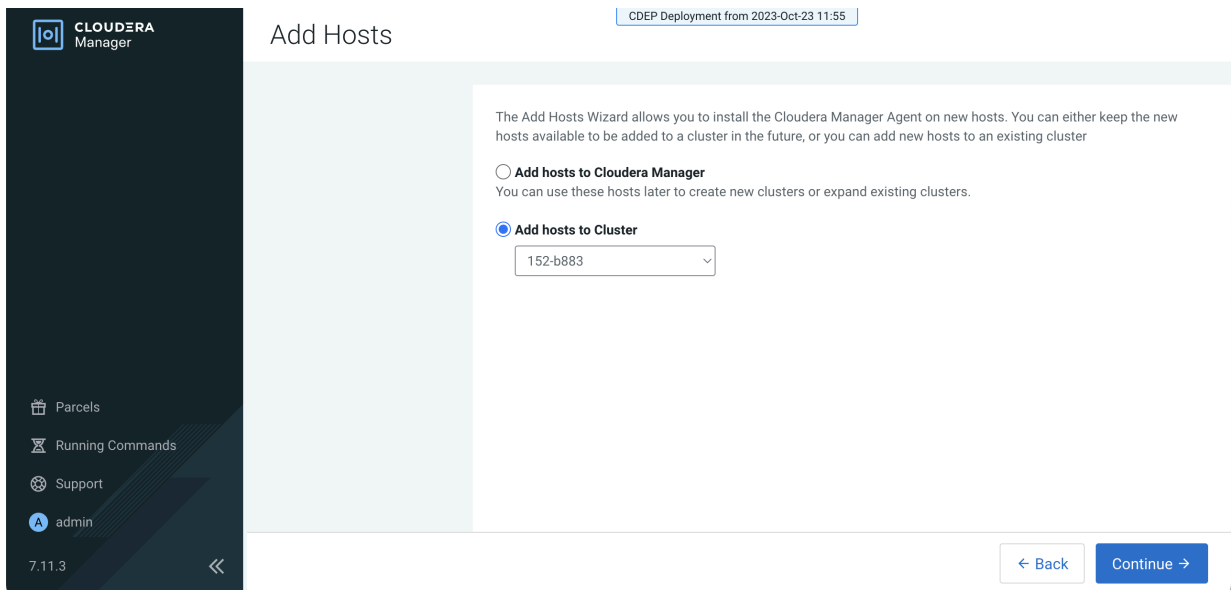

### About this task

**Procedure**

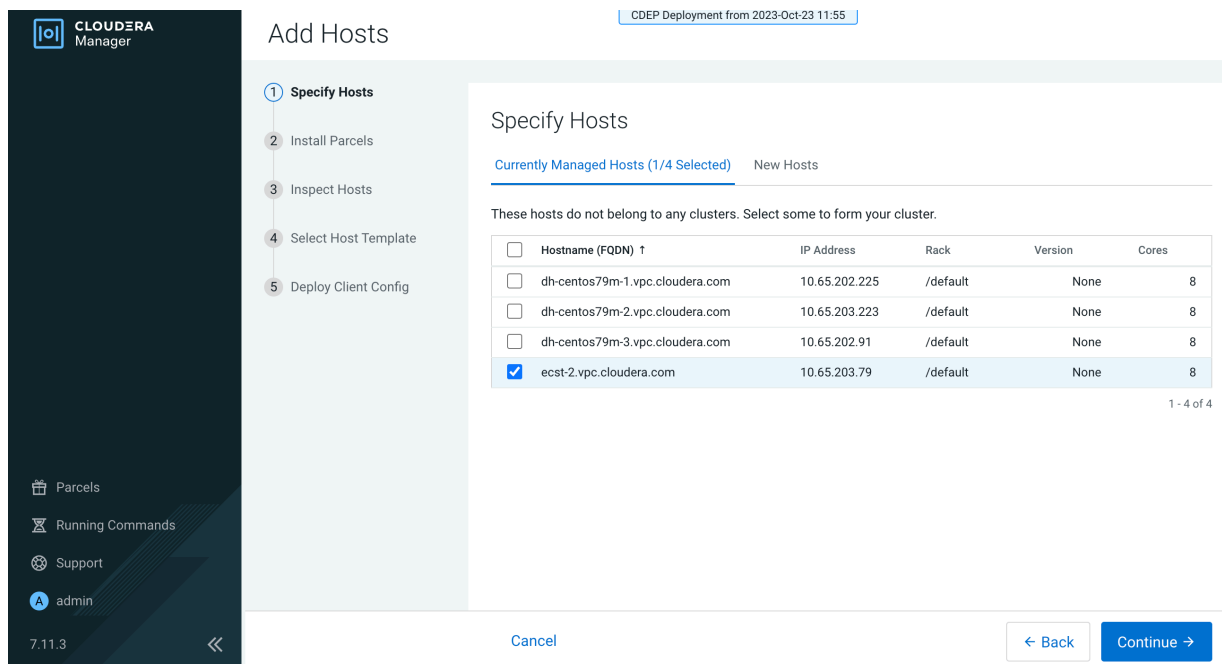

1. On the Cloudera Manager home page, click the ECS Cluster, then select Actions > Add Hosts.

2. On the Add Hosts page, click Add Hosts to Cluster and select the ECS Cluster, then click Continue.

3. On the Specify Hosts page, hosts that have already been added to Cloudera Manager are listed on the Currently Managed Hosts tab. You can select one or more of these hosts to add to the ECS cluster.

**Add Hosts** CDEP Deployment from 2023-Oct-23 11:55

1 Specify Hosts  
2 Install Parcels  
3 Inspect Hosts  
4 Select Host Template  
5 Deploy Client Config

Specify Hosts

Currently Managed Hosts (1/4 Selected) New Hosts

These hosts do not belong to any clusters. Select some to form your cluster.

<input type="checkbox"/>	Hostname (FQDN) ↑	IP Address	Rack	Version	Cores
<input type="checkbox"/>	dh-centos79m-1.vpc.cloudera.com	10.65.202.225	/default	None	8
<input type="checkbox"/>	dh-centos79m-2.vpc.cloudera.com	10.65.203.223	/default	None	8
<input type="checkbox"/>	dh-centos79m-3.vpc.cloudera.com	10.65.202.91	/default	None	8
<input checked="" type="checkbox"/>	ecst-2.vpc.cloudera.com	10.65.203.79	/default	None	8

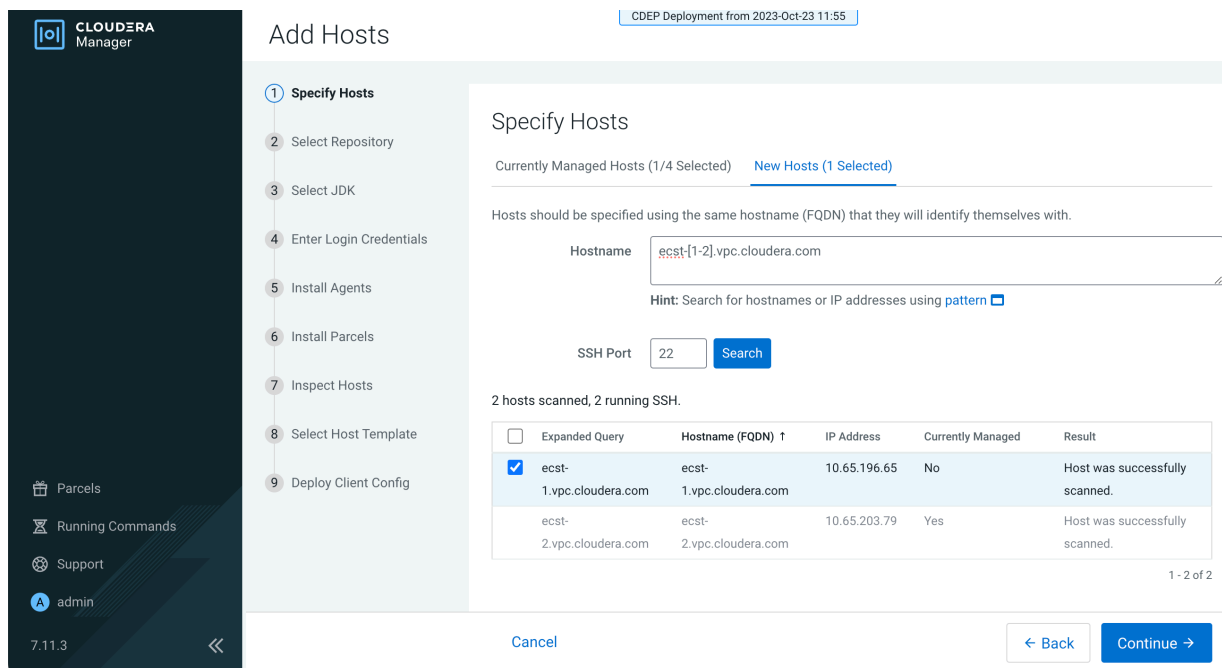

1 - 4 of 4

Cancel ← Back Continue →

You can also click the New Hosts tab to specify one or more hosts that have not been added to Cloudera Manager. Enter a Fully Qualified Domain Name in the Hostname box, then click Search.

**Note:** Click the pattern link under the Hostname box to display more information about allowed FQDN patterns.

**Add Hosts** CDEP Deployment from 2023-Oct-23 11:55

1 Specify Hosts  
2 Select Repository

### Select JDK

CDH Version	Supported JDK Version
7.1.9 and above	OpenJDK 8, 11, 17 or Oracle JDK 8, 11, 17
7.1.1 to 7.1.8	OpenJDK 8, 11 or Oracle JDK 8, 11
7.0 and above	OpenJDK 8 or Oracle JDK 8
6.3 and above	OpenJDK 8 or Oracle JDK 8
6.2	OpenJDK 8 or Oracle JDK 8
6.1 or 6.0	Oracle JDK 8
5.16 and above	OpenJDK 8 or Oracle JDK 8
5.7 to 5.15	Oracle JDK 8

1 - 8 of 8  
[More details on supported JDK version.](#)

If you plan to use JDK 11 with CDH 7.1.x and above or JDK 17 with CDH 7.1.9 and above, you will need to install it manually on all hosts and then select the **Manually manage JDK** option below.

Manually manage JDK

Install a Cloudera-provided version of OpenJDK

By proceeding, Cloudera will install a supported version of OpenJDK version 8.

Install a system-provided version of OpenJDK

By proceeding, Cloudera will install the default version of OpenJDK version 8 provided by the Operating System.

Please ensure that a supported JDK is **already installed** on all hosts. You will need to manage installing the unlimited strength JCE policy file, if necessary.

Cancel Back Continue

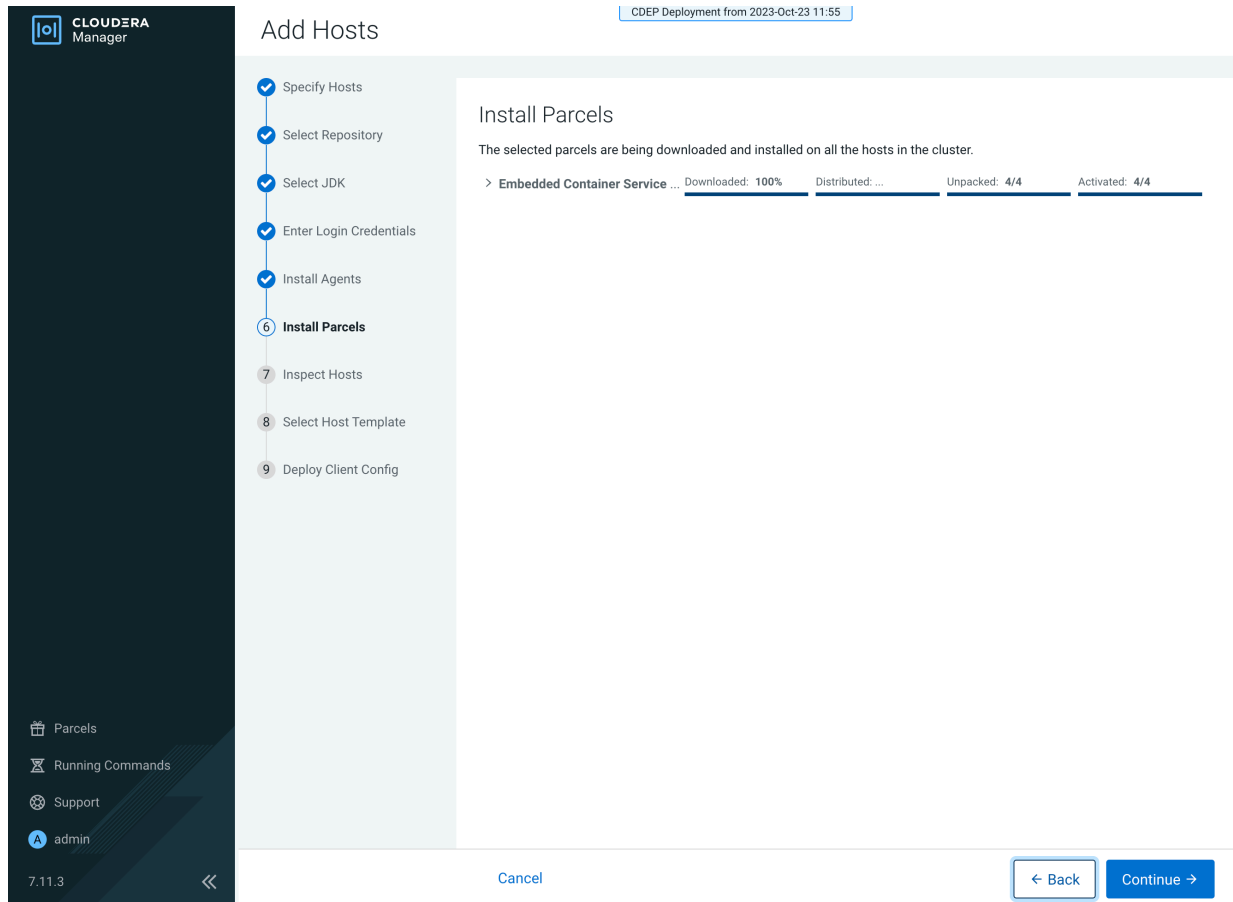

- On the Enter Login Credentials page, All hosts accept the same password is selected by default. Enter the user name in the SSH Username box, and type in and confirm the password. You can also select the All hosts accept the same private key option and provide the Private Key and passphrase.

The screenshot shows the Cloudera Manager interface for adding hosts. The left sidebar contains a navigation menu with the following items: Parcels, Running Commands, Support, and admin. The main content area is titled 'Add Hosts' and shows a progress indicator with steps 1 through 9. Step 4, 'Enter Login Credentials', is the current step. The form includes the following fields and options:

- SSH Username:** A text input field containing 'root'.
- Authentication Method:** Two radio button options: 'All hosts accept same password' (selected) and 'All hosts accept same private key'.
- Password:** A password input field with masked characters '.....'.
- Confirm Password:** A password input field with masked characters '.....' and a blue border.
- SSH Port:** A text input field containing '22'.
- Simultaneous Installations:** A text input field containing '10'. Below this field is a note: '(Running a large number of installations at once can consume large amounts of network bandwidth and other system resources)'.

At the bottom of the form, there are three buttons: 'Cancel', '< Back', and 'Continue >'. The 'Continue >' button is highlighted in blue. A timestamp 'CDEP Deployment from 2023-Oct-23 11:55' is visible in the top right corner of the main content area.

- 7. The Cloudera Manager agents are installed, and then the Install Parcels page appears. The selected parcel is downloaded to the Cloudera Manager server host, distributed, unpacked, and activated on the ECS cluster hosts. Click Continue.

8. Review the Validations list on the Inspect Hosts page. If issues are detected, you can fix the issues, then click Run Again to repeat the host inspection. Click Continue.

7.11.3

9. The Select Host Template page lists available host templates. Click Create.

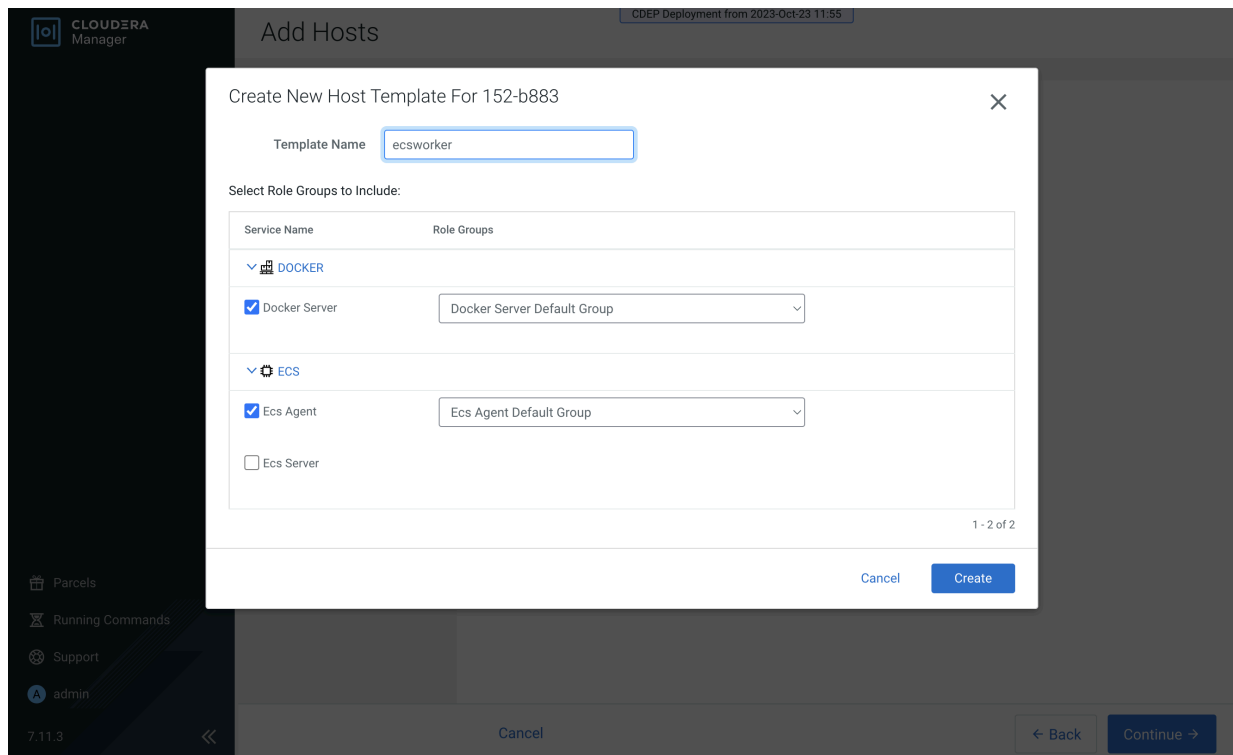

**Note:**

The following three steps describe how to create a host template to assign the Docker Server and Ecs Agent role groups to the new host. You can also select None and add these role instances after adding the new host to the cluster, as described at the end of this topic.

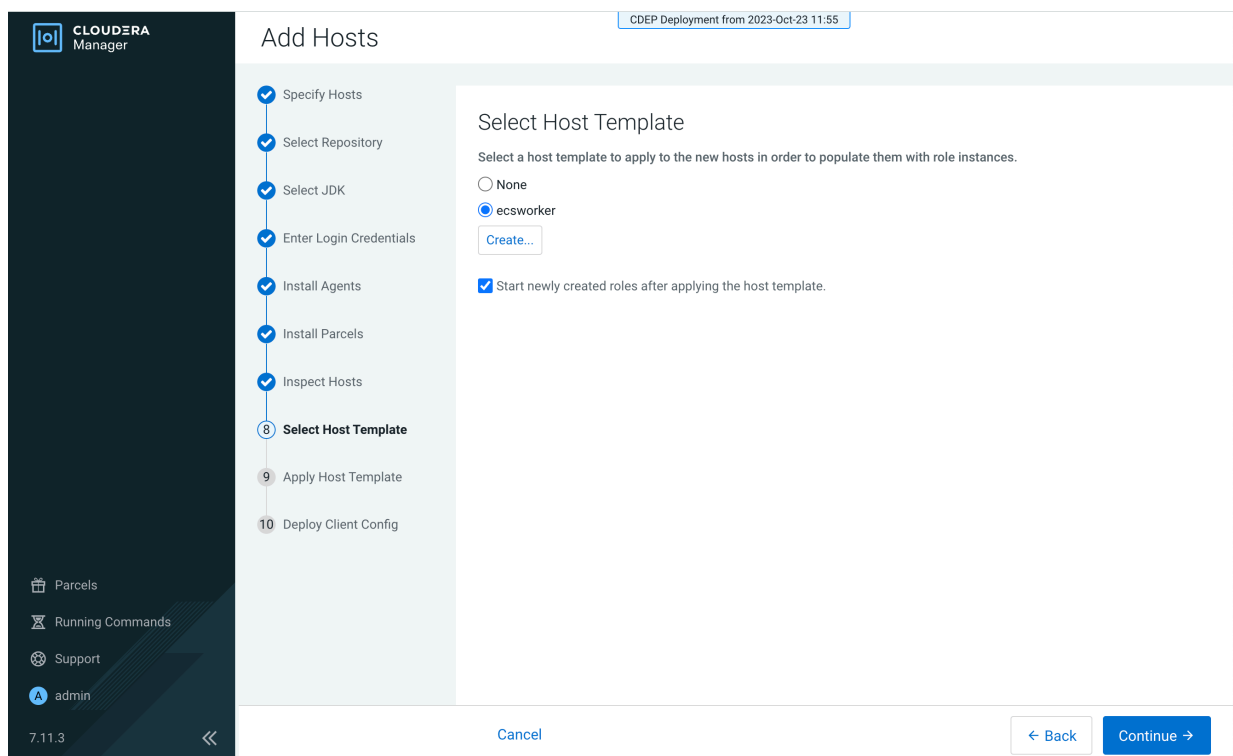

The screenshot shows the Cloudera Manager interface for adding hosts. The left sidebar contains the Cloudera Manager logo and navigation options: Parcels, Running Commands, Support, and a user profile for 'admin'. The main content area is titled 'Add Hosts' and features a progress bar with the following steps: Specify Hosts, Select Repository, Select JDK, Enter Login Credentials, Install Agents, Install Parcels, Inspect Hosts, **Select Host Template** (the current step), and Deploy Client Config. The 'Select Host Template' section prompts the user to 'Select a host template to apply to the new hosts in order to populate them with role instances.' and offers a radio button for 'None' and a 'Create...' button. The bottom navigation bar includes a 'Cancel' button, a '< Back' button, and a 'Continue >' button.

10. On the Create New Host Template pop-up, enter a template name and select the Docker Server and Ecs Agent role groups, then click Create.

11. On the Select Host Template page, select the new template, then click Continue.

12. The Apply Host Template page appears. After the roles have successfully started, click Continue.

The screenshot shows the Cloudera Manager interface for the 'Add Hosts' task. The left sidebar contains a navigation menu with the following items: Parcels, Running Commands, Support, and admin. The main content area is titled 'Add Hosts' and shows a progress bar with 10 steps. The current step is 'Apply Host Template', which is highlighted with a blue circle and a checkmark. The previous steps are also marked with checkmarks, while the final step 'Deploy Client Config' is marked with a grey circle and a checkmark. The 'Apply Host Template' step details are as follows:

**Apply Host Template**  
Start Roles on Hosts When Free Command  
Status: ✔ **Finished** 📅 Dec 12, 10:20:41 PM ⌚ 48.4s  
Successfully started all the roles on selected hosts.  
Completed 3 of 3 step(s).  
 Show All Steps  Show Only Failed Steps  Show Only Running Steps

> <span style="color: green;">✔</span> Wait for Service Commands	<a href="#">DOCKER</a>	Dec 12, 10:20:41 PM	99ms
> <span style="color: green;">✔</span> Wait for Service Commands	<a href="#">ECS</a>	Dec 12, 10:20:41 PM	100ms
> <span style="color: green;">✔</span> Starts all the roles on the selected hosts.	<a href="#">🔗</a>	Dec 12, 10:20:41 PM	48.25s

At the bottom of the page, there are three buttons: 'Cancel', '← Back', and 'Continue →'.

13. The Deploy Client Config page appears. After all client configurations have been successfully deployed, click Finish.

The screenshot shows the Cloudera Manager interface during the 'Add Hosts' process. The left sidebar contains a navigation menu with options like 'Parcels', 'Running Commands', 'Support', and 'admin'. The main area is titled 'Add Hosts' and shows a progress list of steps: Specify Hosts, Select Repository, Select JDK, Enter Login Credentials, Install Agents, Install Parcels, Inspect Hosts, Select Host Template, Apply Host Template, and '10 Deploy Client Config'. The 'Deploy Client Config' step is highlighted and expanded to show a 'Deploy Client Config' window. This window displays the command 'Deploy Client Configuration Command', a status of 'Finished', and a message: 'Successfully deployed all client configurations.' Below this, it indicates 'Completed 1 of 1 step(s)' and provides options to 'Show All Steps', 'Show Only Failed Steps', or 'Show Only Running Steps'. A table shows the execution details: 'Execute DeployClusterClientConfig for {} in parallel.' with a timestamp of 'Dec 12, 10:26:12 PM' and a duration of '57ms'. At the bottom of the window, there are 'Cancel', 'Back', and 'Finish' buttons.

14. The new host is listed on the ECS cluster Hosts page.

The screenshot shows the Cloudera Manager 'Hosts' page for cluster '152-b883'. The left sidebar has a search bar and navigation options like 'Clusters', 'Hosts', 'Diagnostics', 'Audits', 'Charts', 'Replication', 'Administration', and 'Data Services'. The main area is titled 'Hosts' and includes tabs for 'Configuration', 'Add Hosts', 'Review Upgrade Status', 'Inspect Hosts in Cluster', and 'Inspect Cluster Network Performance'. A search bar and a 'Filters' toggle are present. Below the search bar is a 'Filters' panel with expandable sections for 'STATUS' (showing 'Good Health' with 4 items), 'CLUSTERS', 'CORES', 'COMMISSION STATE', 'LAST HEARTBEAT', 'LOAD (1 MINUTE)', 'LOAD (5 MINUTES)', 'LOAD (15 MINUTES)', 'MAINTENANCE MODE', 'UPGRADE DOMAIN', 'RACK', and 'SERVICE'. To the right, there is a table of hosts with columns for 'Status', 'Name', 'IP', 'Roles', 'Tags', 'Commission State', and 'Last He'. The table contains four rows of host information, all with a 'Good Health' status and 'Commissioned' state. At the bottom right of the table, it says '1 - 4 of 4'.

- 15.** If your ECS hosts are running the CentOS 8.4, OEL 8.4, RHEL 7.9, or RHEL 8 operating systems, you must install iptables on all the ECS hosts.

For CentOS 8.4, OEL 8.4, or RHEL 8, run the following command on each ECS host:

```
yum --setopt=tsflags=noscripts install -y iptables
```

For RHEL 7.9, run the following command on each ECS host:

```
yum install -y iptables
```

16. If you did not apply a host template to assign roles, perform the following steps to assign the Docker Server and Ecs Agent role groups to the new host.

To assign the Docker Server role group:

a. Click DOCKER on the ECS cluster home page, select Instances, then click Add Role Instances.

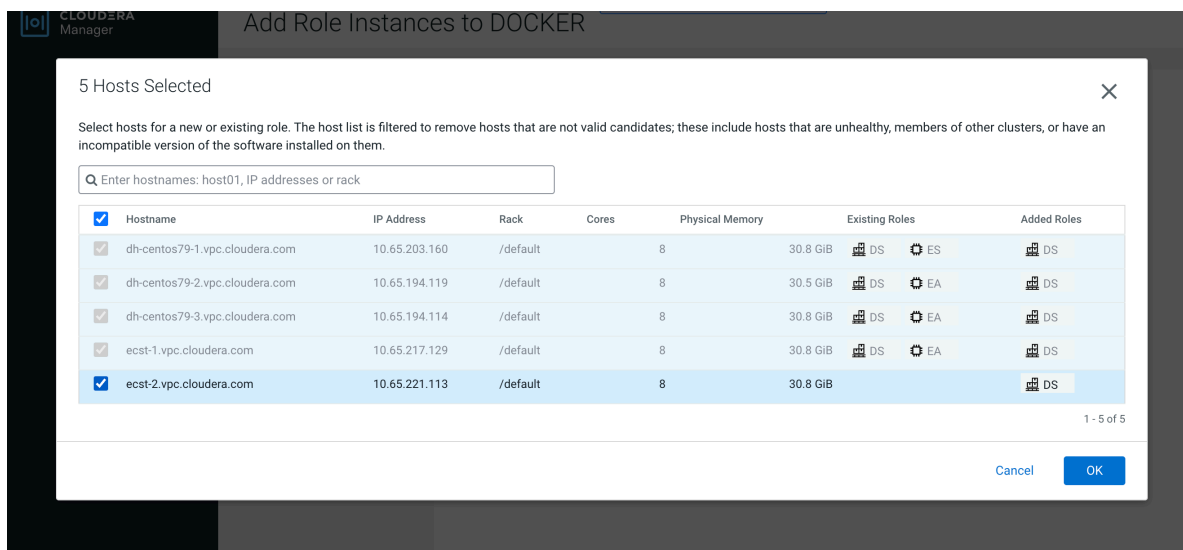

The screenshot shows the Cloudera Manager interface for a cluster named '152-b883'. The 'DOCKER' cluster is selected, and the 'Instances' tab is active. A search bar is present with the text 'Enter search terms (hostname, host ID, IP address, cluster name, rack, health)'. A filters panel on the left shows 'STATUS' with 'Good Health' (4 instances). The main table displays four instances of the 'Docker Server' role, all in a 'Started' state and 'Commissioned'. The 'Add Role Instances' button is highlighted in orange.

Status	Role Type	Tags	State	Hostname	Commission State	Role Group
<input type="checkbox"/>	Docker Server		Started	dh-centos79-3.vpc.cloudera.com	Commissioned	Docker Server Default Group
<input type="checkbox"/>	Docker Server		Started	dh-centos79-1.vpc.cloudera.com	Commissioned	Docker Server Default Group
<input type="checkbox"/>	Docker Server		Started	dh-centos79-2.vpc.cloudera.com	Commissioned	Docker Server Default Group
<input type="checkbox"/>	Docker Server		Started	ecst-1.vpc.cloudera.com	Commissioned	Docker Server Default Group

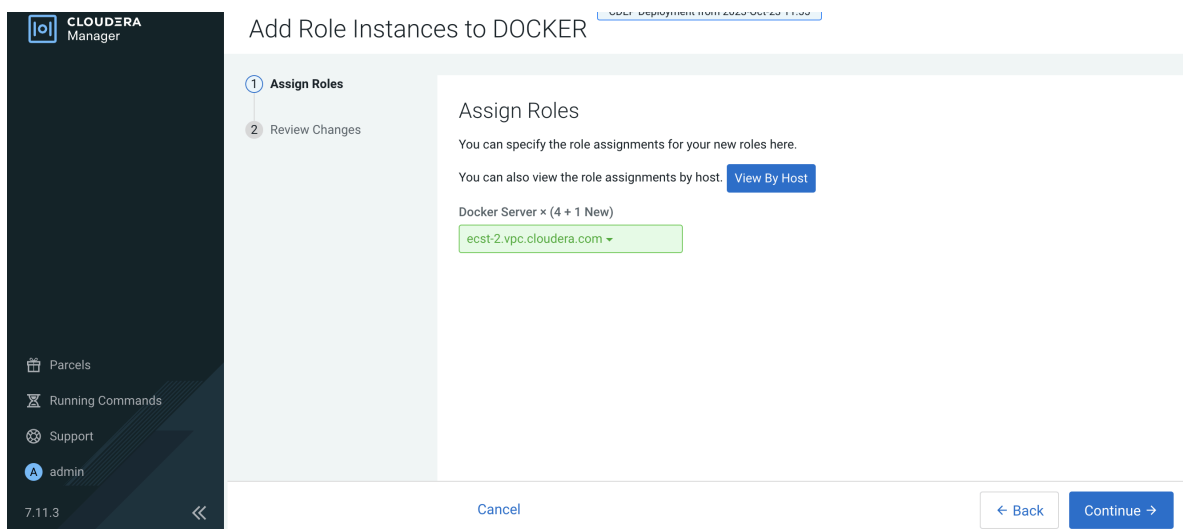

b. On the Add Role Instances to DOCKER page, click Select hosts.

The screenshot shows the 'Add Role Instances to DOCKER' page. The 'Assign Roles' section is active, and the 'Select hosts' button is highlighted in orange. The page indicates that there are 4 Docker Server instances to be assigned.

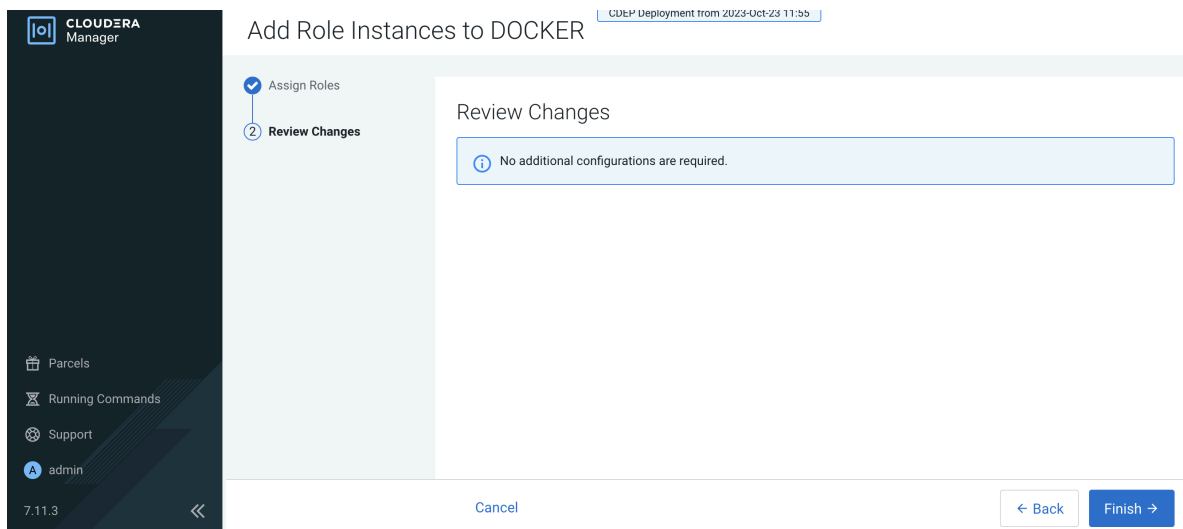

c. On the Hosts Selected pop-up, select the new host, then click OK.

- d. On the Assign Roles page, click Continue.

- e. On the Review Changes page, click Finish.

- f. The new host is listed on the Docker Instances page.

152-b883

- b. On the Add Role Instances to ECS page, in the Ecs Agent box, click Select hosts.

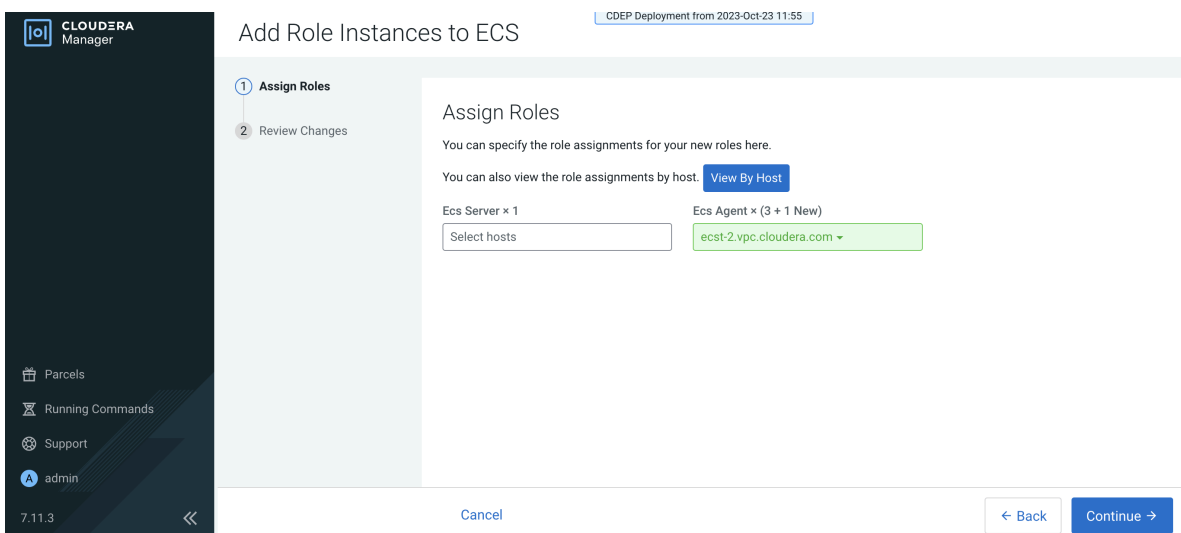

**Important:** Be sure to click Select hosts in the Ecs Agent box – do not click the link in the Ecs Server box.

c. On the Hosts Selected pop-up, select the new host, then click OK.

d. On the Assign Roles page, click Continue.

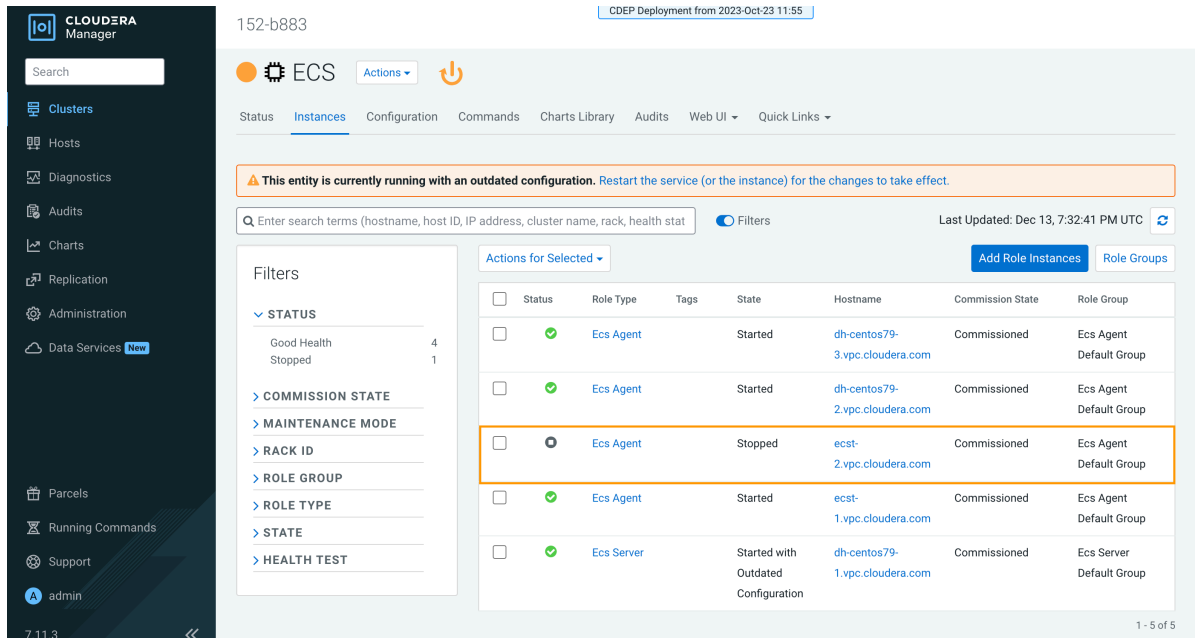

e. On the Review Changes page, click Finish.

f. The new host is listed on the ECS Instances page.

17. Restart the ECS cluster by clicking the ECS Restart icon, or by selecting Actions > Restart on the ECS cluster home page.

The screenshot shows the Cloudera Manager interface for an ECS cluster. The cluster ID is 152-b883. The status is 'Stale Configuration: Restart needed'. The 'Actions' menu is open, showing options like Start, Stop, Restart, and Unseal Vault. The 'Charts' section shows Cluster CPU, Cluster Disk IO, and Cluster Network IO usage.

18. Click ECS on the ECS cluster home page, then select Actions > Unseal Vault.

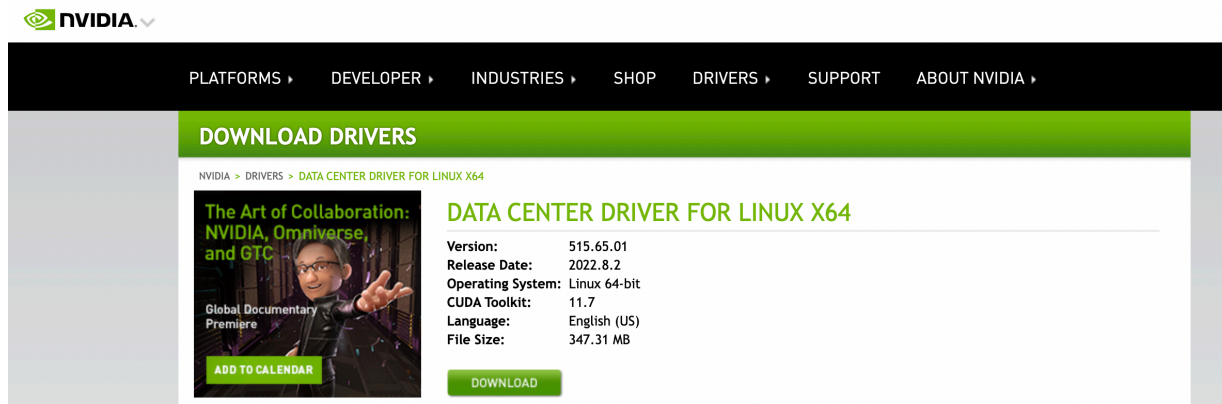

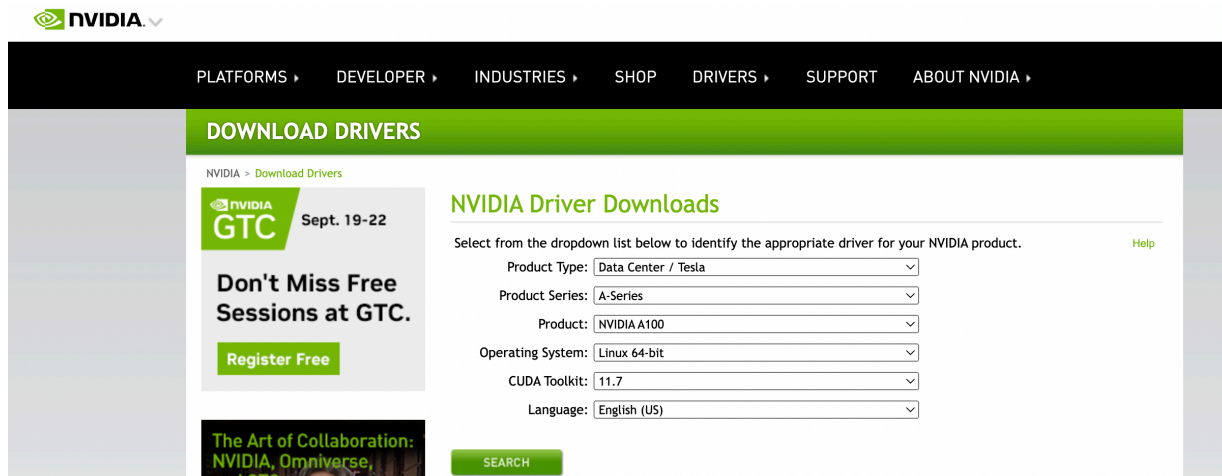

The screenshot shows the Cloudera Manager interface for an ECS cluster. The cluster ID is 152-b883. The 'Actions' menu is open, showing options like Start, Stop, Restart, and Unseal Vault. The 'Health Tests' section shows 'Kubernetes Health' and 'Longhorn Health' with alerts. The 'Status Summary' section shows 'Ecs Agent' with 3 Good Health, 'Ecs Server' with 1 Good Health, and 'Hosts' with 4 Good Health.

## Installing NVIDIA GPU software in ECS

After you add a host containing a NVIDIA GPU card in an Embedded Container Service (ECS) cluster, you must install the NVIDIA GPU software driver and its associated software. You can then test the GPU card in the Cloudera Machine Learning (CML) workspace.

## Installing the NVIDIA driver and container runtime

1. Use the [NVIDIA Driver Downloads](#) page to determine the software driver version required for your NVIDIA GPU card. This example uses a NVIDIA A100 GPU card, which requires driver version 515.65.01.

2. Run the following command to cordon the GPU worker node:

```
# kubectl cordon ecsgpu.cdpkvm.cldr node/ecsgpu.cdpkvm.cldr cordoned
```

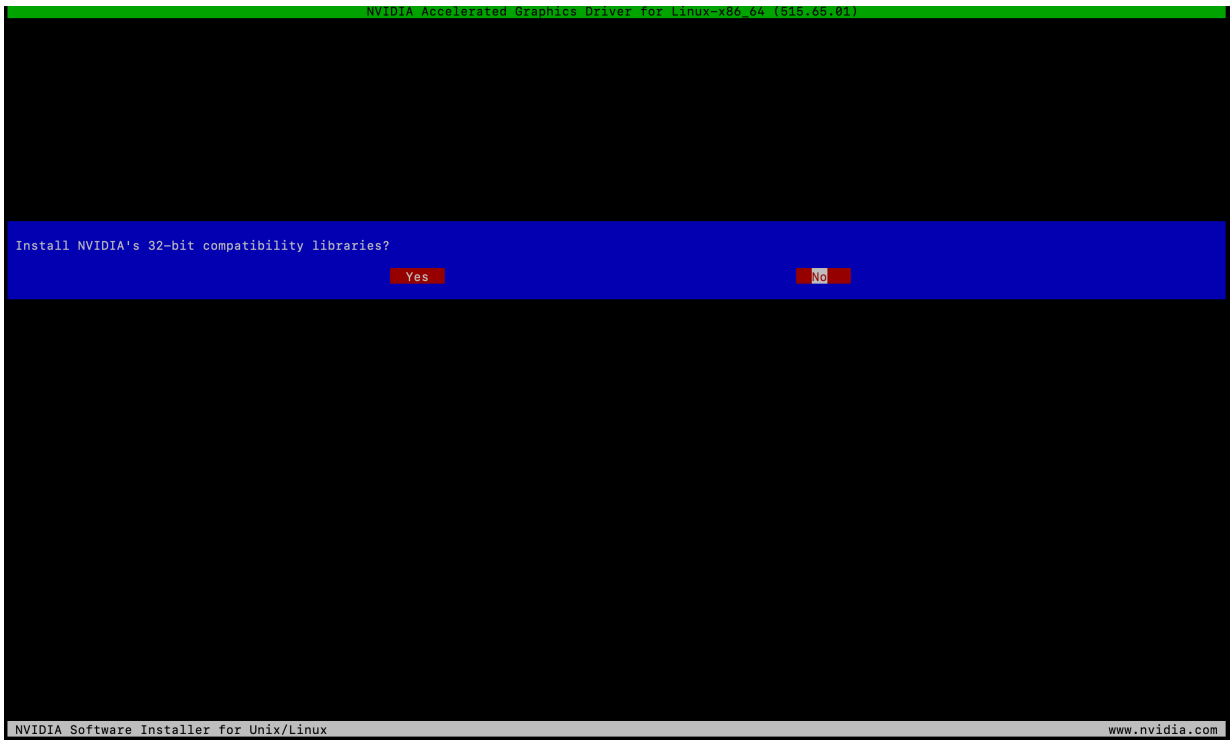

3. On the ECS host with the NVIDIA GPU card, install the required Operating System (OS) software packages as shown below, and then reboot the node. In this example, the host OS is Centos 7.9, and the host name of the node with the GPU card is ecsgpu.cdpkvm.cldr.

```
# yum update -y# yum install -y tar bzip2 make automake gcc gcc-c++ pciu
tils elfutils-libelf-devel libglvnd-devel vim bind-utils wget
# yum install -y https://dl.fedoraproject.org/pub/epel/epel-release-latest
-7.noarch.rpm
# yum -y group install "Development Tools"# yum install -y kernel-devel-$(
uname -r) kernel-headers-$(uname -r)
# reboot
```

4. Next, run the following commands to install the NVIDIA driver and nvidia-container-runtime software:

```
# BASE_URL=https://us.download.nvidia.com/tesla# DRIVER_VERSION=515.65.01
# curl -fSsl -O $BASE_URL/$DRIVER_VERSION/NVIDIA-Linux-x86_64-$DRIVER_VERS
ION.run
```

```
# sh NVIDIA-Linux-x86_64- $\$$ DRIVER_VERSION.run
```

- After the installation is complete, run the `nvidia-smi` tool and ensure that the driver was successfully deployed. The output should look similar to the following example:

```
[root@ecsgpu ~]# nvidia-smi

nvidia-container-runtime-3.11.0-1.noarch
nvidia-container-toolkit-1.11.0-1.x86_64

# nvidia-container-toolkit -version
NVIDIA Container Runtime Hook version 1.11.0

```

```
commit: d9de4a0
# reboot
```

### 7. Uncordon the GPU worker node:

```
# kubectl uncordon ecsgpu.cdpkvm.cldr node/ecsgpu.cdpkvm.cldr cordoned
```

## Testing the NVIDIA GPU card in CML

1. SSH into the ECS master node in the CDP Private Cloud Data Services cluster and run the following command to ensure that the `ecsgpu.cdpkvm.cldr` host has the `nvidia.com/gpu:` field in the node specification. Host `ecsgpu.cdpkvm.cldr` is a typical ECS worker node with the NVIDIA GPU card installed.

```
[root@ecsmaster1 ~]# kubectl describe node ecsgpu.cdpkvm.cldr | grep-A15
Capacity:
Capacity:
  cpu: 16
  ephemeral-storage: 209703916Ki
  hugepages-1Gi: 0
  hugepages-2Mi: 0
  memory: 263975200Ki
  nvidia.com/gpu: 1
  pods: 110
Allocatable:
  cpu: 16
  ephemeral-storage: 203999969325
  hugepages-1Gi: 0
  hugepages-2Mi: 0
  memory: 263975200Ki
  nvidia.com/gpu: 1
  pods: 110

[root@ecsmaster1 ~]# kubectl describe node ecsworker1.cdpkvm.cldr | grep-
A13 Capacity:
Capacity:
  cpu: 16
  ephemeral-storage: 103797740Ki
  hugepages-1Gi: 0
  hugepages-2Mi: 0
  memory: 263974872Ki
  pods: 110
Allocatable:
  cpu: 16
  ephemeral-storage: 100974441393
  hugepages-1Gi: 0
  hugepages-2Mi: 0
  memory: 263974872Ki
  pods: 110
```

- In the CDP Private Cloud Data Services CML workspace, select Site Administration > Runtime/Engine. Specify a number for Maximum GPUs per Session/Job. This procedure effectively allows the CML session to consume the GPU card.

The screenshot shows the 'Site Administration / Runtime/Engine' configuration page in Cloudera Machine Learning. The top navigation bar includes 'Project quick find' and a user profile 'ldapuser1'. The main content area is divided into several sections:

- Resource Profile:** 1 vCPU, 1.75 GiB memory. A dropdown menu for 'Maximum GPUs per Session/Job' is set to 1.
- Enable CPU bursting:** A checkbox is checked. Below it, a note states: 'By default, Resource Profiles are using burstable CPU settings to help better resource utilization. To use the resource profile as a hard limit on vCPU consumption, disable CPU bursting.'
- Engine Images:** A table lists Docker images for project owners. The 'Default engine image' is 'ecsgpu.cdpkvm.cldr:5000/cloudera/cdsw/engine:16-cml-2022.01-2' with 'Jupyter Notebook' as the editor. There are 'Edit' and 'Deprecate' buttons for this image, and an 'Add' button for a new entry.
- Environment variables:** A section for setting environment variables for all users' sessions and jobs. It includes a table with columns for 'Name', 'Value', and 'Actions', with an 'Add' button.

At the bottom, it shows 'Workspace: ws1' and 'Cloud Provider: (ECS)'. The version is 'dev (2.0.31-b62)'.

- Create a CML project and start a new session by selecting the Workbench editor with a Python kernel and a NVIDIA GPU edition. Specify the number of GPUs to use – in this example, 1 GPU is specified.

The screenshot shows the Cloudera Machine Learning interface. On the left is a code editor with a file explorer showing a project structure including files like 'analysis.ipynb', 'cdsw-build.sh', 'config.yml', 'entry.py', 'fit.py', 'lineage.yml', 'pi.py', 'predict.py', 'predict\_with\_metrics.py', 'README.md', 'requirements.txt', 'seaborn-data', 'Untitled.py', and 'use\_model\_metrics.py'. The code editor contains the following Python code:

```
1 import torch
2 torch.cuda.is_available()
3 torch.cuda.current_device()
```

On the right is the 'Start A New Session' dialog. The 'Session Name' field is set to 'test'. Under the 'Runtime' section, the 'Editor' is 'Workbench', the 'Kernel' is 'Python 3.9', and the 'Edition' is 'Nvidia GPU'. The 'Version' is '2021.12'. There is an 'Enable Spark' checkbox which is unchecked, and a 'Spark 3.2.0 - CDE 1.15 - HOTFIX' dropdown menu. The 'Runtime Image' is 'ecsgpu.cdpkvm.cldr:5000/cloudera/cdsw/ml-runtime-workbench-python3.9-cuda2021.12.1-b17'. Under the 'Resource Profile' section, the profile is '2 vCPU / 8 GiB Memory' and the number of GPUs is '1 GPU'. At the bottom, there are 'Cancel' and 'Start Session' buttons.

4. Create a new Python file and run the following script. Also, open the terminal session and run the `nvidia-smi` tool. Note that the output shows the NVIDIA GPU card details.

```
!pip3install torchimport torchtorch.cuda.is_available()torch.cuda.device
_count()torch.cuda.get_device_name(0)
```

The screenshot shows a JupyterLab environment with a Python script in a file named `Untitled.py`. The script contains the following code:

```
1 import torch
2 torch.cuda.is_available()
3 torch.cuda.current_device()
```

The terminal output shows the execution of the script and the `nvidia-smi` command. The `nvidia-smi` output is as follows:

```
cdsw@lfz6t8mvxv5ghwy:~$ nvidia-smi
Thu Aug 25 04:36:59 2022

```

- Navigate to the CML Projects page and confirm that the User Resources dashboard displays the GPU card availability.

The screenshot shows the Cloudera Machine Learning interface. On the left is a navigation sidebar with options like Projects, Sessions, Experiments, Models, Jobs, Applications, User Settings, AMPs, Runtime Catalog, Site Administration, and Learning Hub. The main content area is titled 'Projects' and includes a search bar, a 'View Resource Usage Details' link, and a table of 'Active Workloads'.

SESSIONS	EXPERIMENTS	MODELS	JOB	APPLICATIONS
1	0	0	0	0

The 'User Resources' section shows a bar chart comparing 'User Reserved' (blue) and 'User Available' (grey) resources:

- CPU: 2.0 vCPU, 74.1 available
- Memory: 8.0 GiB, 986.2 available
- GPU: 1.0 GPU, 0.0 available

Below the resources, there is a search bar for projects, filters for 'Scope' (My Projects) and 'Creator' (All), and a 'New Project' button. A project card for 'test' is visible, showing it was created by 'ldapuser1' and last worked on 3 minutes ago. The footer indicates the workspace is 'ws1' and the cloud provider is 'ECS'.

This screenshot is similar to the one above but highlights the 'Workspace Resources' section. The 'Active Workloads' table remains the same. The 'Workspace Resources' section shows a bar chart comparing 'Workspace Usage' (blue) and 'Workspace Available' (grey) resources:

- CPU: 5.9 vCPU, 74.1 available
- Memory: 20.8 GiB, 986.2 available
- GPU: 1.0 GPU, 0.0 available

The rest of the interface, including the sidebar, search filters, and project card, is identical to the previous screenshot.

- SSH into the ECS master node and run the following command to verify that the node that hosting the above CML project session pod is ecsgpu.cdpkvm.cldr.

```
[root@ecsmaster1 ~]# oc -n workspace1-user-1 describe pod wifz6t8mvxv5ghwy | grep Node:
Node:          ecsgpu.cdpkvm.cldr/10.15.4.185

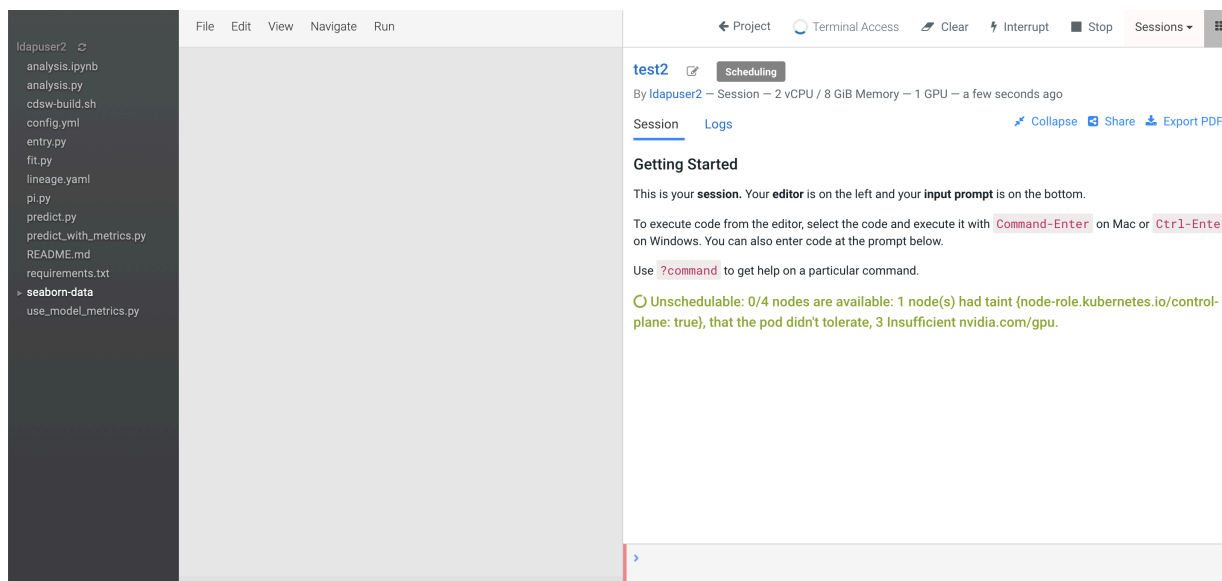

[root@ecsmaster1 ~]# oc -n workspace1-user-1 describe pod wifz6t8mvxv5ghwy | grep -B2 -i nvidia
Limits:
  memory:          7714196Ki
  nvidia.com/gpu:  1
--
  cpu:             1960m
  memory:          7714196Ki
  nvidia.com/gpu:  1
```

7. When a process is consuming the NVIDIA GPU, the output of the nvidia-smi tool shows the PID of that process (in this case, the CML session pod).

```
[root@ecsgpu ~]# nvidia-smi
Thu Aug 25 13:58:40 2022

```

- In the event that the ECS platform has no available worker node with a GPU card, provisioning a session with GPU will result in a Pending state as the system is looking for a worker node installed with at least one NVIDIA GPU card.

## Decommissioning ECS Hosts

You can decommission ECS hosts and remove them from the cluster.

### About this task

- Cordon the node. Longhorn will automatically disable the node scheduling when a Kubernetes node is cordoned. Run the following command on any ECS Server host:

```
kubectl cordon [***node***]
```

- Drain the node to move the workload to somewhere else. Run the following command on any ECS Server host:

```
kubectl drain [***node***] --ignore-daemonsets --pod-selector='app!=csi-attacher,app!=csi-provisioner' --delete-emptydir-data
```

- Detach all the volumes on the node. Navigate to the ECS Service page on Cloudera Manager UI.

- In the Web UI dropdown, select Storage UI to open the Longhorn UI.
- Under the Volume tab in Longhorn UI, select the volumes on this node. Click Detach and select Yes on the screen prompt.

If the node has been drained, all the workloads should be migrated to another node already.

If there are any other volumes remaining attached, detach them before continuing.

- Remove the node from Longhorn using the Delete in the Node tab. Or, remove the node from Kubernetes. Run the following command on any ECS Server host:

```
kubectl delete node [***node-name***]
```

Longhorn will automatically remove the node from the cluster.

- Uninstall ECS and Docker artifacts from the host. Run below commands on the host:

```
cd /opt/cloudera/parcels/ECS/bin
./rke2-killall.sh # usually 2 times is sufficient
```

```
./rke2-uninstall.sh
rm -rf /ecs/* # assumes the default defaultDataPath and IsoDataPath
rm -rf /var/lib/docker_server/* # deletes the auth and certs
rm -rf /etc/docker/certs.d/* # delete the ca.crt
rm -rf /docker # assumes the default defaultDataPath for docker
```

- Go to the Hosts page for the ECS Cluster, select that host, and under Actions for Selected, click Begin Maintenance (Suppress Alerts/Decommission)

## ECS Server High Availability

ECS Server High Availability (HA) is not enabled by default – you must enable it after installing ECS. If you do not wish to enable ECS HA, you can safely ignore this section. If you are enabling ECS HA, you should review the following notes and supported ECS Server scenarios before proceeding.

### Note:

- Longhorn replication defaults to two replicas. This can be set only during the installation time. Three or more replicas potentially have performance issues.
- Kubectl delete node <host> permanently removes host from cluster and any data on the host is lost. You must reformat the host before rejoining to the cluster.
- Single node failure may cause the Control Plane or any other management service to be unavailable. In 1.3.4 or later, it will take several minutes to recover automatically.

### ECS Server scenarios

Clusters with only two servers are not supported. This is only for the temporary transition from a single server cluster to a three server cluster.

#### 1. Three or more servers

- Redundancy requirements:
  - One failure requires three or more servers
  - Two failures require five or more servers
  - For more information see, [Fault Tolerance](#)
- To recover, you must scale-up the ECS Server roles. For more information on adding ECS node to a cluster, see the following section.

#### 2. Two servers to one server

- Only after a double failure in a three server cluster
- To recover:
  - Stop the ECS service
  - Remove both the failed ECS server roles and hosts from cluster
  - On the surviving server, run the following command `/opt/cloudera/parcels/ECS/bin/rke2 server --cluster-reset`
  - Start the ECS service

#### 3. Single server

- No failure supported

## Enable ECS Server HA Post ECS Installation

If you want to enable ECS Server for High Availability after installing ECS, then you must proceed with this section. If you do not want to enable ECS HA, you can safely ignore this section.

As a prerequisite, during the installation, you must have installed ECS with 1 master (with `app_domain` as Load Balancer URL) + agents. When you are adding more masters, ensure that you add Docker server as well.

### Install iptables on the new ECS master nodes

You must install iptables on all of the additional ECS master nodes.

If your ECS hosts are running the CentOS 8.4, OEL 8.4, or RHEL 8 operating systems, you must install iptables on all the ECS hosts. Run the following command on each additional ECS master node:

```
yum --setopt=tsflags=noscripts install -y iptables
```

### Adding hosts to the containerized cluster

You must add hosts to the containerized cluster.

1. Log in to Cloudera Manager.
2. Navigate to the ECS service.
3. Click the Actions drop-down.
4. Click the Add Hosts button. The Add Hosts page appears.
5. Select the Add hosts to cluster option.
6. Select the cluster where you want to add the host from the drop-down list. Click Continue.
7. In the Specify Hosts page, provide a list of available hosts or you can add new hosts. You can provide the Fully Qualified Domain Name (FQDN) in the following patterns: You can specify multiple addresses and address ranges by separating them by commas, semicolons, tabs, or blank spaces, or by placing them on separate lines. Use this technique to make more specific searches instead of searching overly wide ranges.

For example, use host[1-3].network.com to specify these hosts: host1.network.com, host2.network.com, host3.network.com.

Click Continue.

8. In the Select Repository page, you must specify the repository location. Choose any one of the following:
  - a. Cloudera Repository (Requires direct internet access on all hosts)
  - b. Custom Repository
9. In the Select JDK page, select any one from the below options:
  - a. Manually manage JDK
  - b. Install a Cloudera-provided version of OpenJDK
  - c. Install a system-provided version of OpenJDK
10. In the Enter Login Credentials page select the SSH Username and provide the password.
11. The Install Agents page appears. Click Continue.
12. In the Install Parcels page, the selected parcels are downloaded and installed on the host cluster. Click Continue.
13. In the Inspect Hosts page, you can inspect your hosts. If the inspect tool displays any issues, you can fix those issues and run the inspect tool again. Click Continue.
14. In the Select Host Template page, select the hosts.
15. The Deploy Client Config page appears. Click Finish.

### Adding Role Instances to Docker Server

You must add role instances to the docker server.

1. Log in to Cloudera Manager.
2. Navigate to the ECS service.
3. Open Docker Server.
4. Click the Actions drop-down.
5. Click the Add Role Instances button.
6. Select the hosts.
7. Click OK.

### Adding Role Instances to Containerised Cluster

You must add the role instances to the containerised cluster.

1. Log in to Cloudera Manager.
2. Navigate to the ECS service.
3. Click the Actions drop-down.
4. Click the Add Role Instances button. The Add Role Instances page appears.
5. In the Assign Roles page, specify the role assignments for your new roles. Click Continue.
6. In the Review Changes page, click Finish.

### Starting Docker Server on Nodes

You must start the Docker server on nodes.

1. Log in to Cloudera Manager.
2. Navigate to the ECS service.
3. Open Docker Server.
4. Click the Actions for Selected drop-down.
5. Click Start. Docker Server starts.

### Starting ECS Server on Nodes

You must start the ECS server on nodes.

1. Log in to Cloudera Manager.
2. Navigate to the ECS service.
3. Click the Instances tab.
4. Select the nodes by clicking the checkbox
5. Click the Actions for Selected drop-down.
6. Click Start. ECS Server starts.

### Refreshing ECS

You must refresh the ECS servers.

1. Log in to Cloudera Manager.
2. Navigate to the ECS service.
3. Click the Actions drop-down.
4. Click the Refresh button.

### Checking Nodes and Pods in the UI

You must check the nodes and pods in the UI.

1. Log in to Cloudera Manager.
2. Navigate to the ECS service.
3. Click the Web UI drop-down.
4. Click ECS Web UI. The Kubernetes web UI page opens in a new tab.
5. Check the Nodes and Pods on the Web UI.

## Enable ECS Server HA and promote agents Post ECS Installation

If you want to enable ECS Server for High Availability after installing ECS, then you must proceed with this section. If you do not want to enable ECS HA, you can safely ignore this section.

As a prerequisite, during the installation, you must have installed ECS with 1 master (with app\_domain as Load Balancer URL) + agents. This allows you to promote Agents as masters.

### Enabling ECS Server deployment for High Availability

You can enable ECS Server deployment for High Availability by installing a Load Balancer and promoting the existing ECS Agents to ECS Server. By performing this procedure, you will be able to deploy HA on your existing ECS Server. You must have an ECS cluster installed and configured with a single ECS Server.

If you have a production quality ECS cluster, Cloudera recommends that you configure ECS Server High Availability. You can also consider having an ECS Server HA for any non-production ECS cluster that you expect to be available long-term.

Enabling ECS Server deployment for High Availability involves preparing your cluster, configuring a DNS wildcard entry, adding a Load Balancer into the topology, and promoting ECS Agents to the ECS Server. An ECS High Availability cluster must consist of:

- An odd number of server nodes that will run etcd, the Kubernetes API, and other control plane services. Cloudera recommends a minimum of three ECS Server nodes.
- Two or more agent nodes that are designated to run CDP data services.
- A software or hardware Load balancer using TCP mode (non-terminating https).

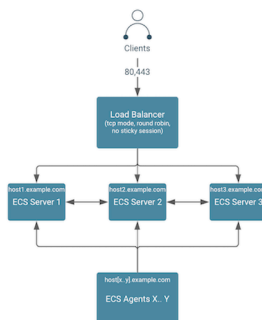

**Note:** A Load Balancer is required for the ECS Server HA. This documentation uses HAProxy as an example. However, Cloudera recommends that you use your production quality Load Balancer technology from commercial vendors.

Architecture of CDP Private Cloud Data Services on a single ECS Server:

Architecture of CDP Private Cloud Data Services with High Availability:

### Preparing the cluster for High Availability:

Review the table to understand the requirements for enabling the High Availability.

1. This process has been tested with a minimum of five ECS hosts. However, Cloudera recommends six or more hosts.
2. DNS requirements for ECS High Availability must be fulfilled.

Hostname	Subdomain	Expected Roles	DNS ForwardZone	Reverse Zone PTR
“Wildcard” (hostname = *)	apps.ecs.example.com The string “apps” is required, “ecs” is up to user	Virtual app domain wildcard	“A Record” wildcard (hostname = *), may be a CNAME on certain DNS systems that use text-based config. Resolves to fixed IP of ha_proxy (or VIP of some commercial LB’s)	N
“apps alias”	apps.ecs.example.com	Virtual app domain alias	“CNAME” alias points to A Record of ha_proxy (or VIP). Alternatively, this can be an ARecord with IP of ha_proxy (or VIP)	N/A
HAProxy (or commercial LB)	<domain of your LB>	HA Load Balancer	Depends on vendor/software	
ecs-master1	example.com	ECS Server 1 Docker server	“A Record” resolves to IP of ecs-master1	Y
ecs-master2	example.com	ECS Server 2 Docker server	“A Record” resolves to IP of ecs-master2	Y
ecs-master3	example.com	ECS Server 3 Docker server	“A Record” resolves to IP of ecs-master3	Y
ecs-agentN	example.com	ECS Agent N Docker server N	“A Record” resolves to IP of ecs-agentN	Y

**Note:**

1. The above table uses a consistent subdomain (“example.com”) but this is not mandatory. To support multiple domains, you must follow certain steps to ensure that the domains are forward and reverse resolvable using DNS, from all Base cluster and ECS cluster hosts (that is through forest/domain level trusts and/or hosts level /etc/resolv.conf config). You must avoid the use of /etc/hosts entries.
2. A predefined wildcard DNS record allows the resolution of \*.apps.<app domain name> to the IP address of the Load Balancer. You cannot proceed further until this is in place.

### High Level steps to enable an ECS High Availability cluster

Review the high level steps to understand the steps in enabling High Availability.

## Enabling ECS High Availability Cluster

- 1 [Verifying DNS Setup](#)
- 2 [Installing Load Balancer](#)
- 3 [Promoting ECS Agents to ECS Servers](#)
- 4 [Refreshing ECS Cluster](#)

### Note:

1. You must have installed an ECS with one ECS server and other nodes that are ECS Agents.
2. You must have a DNS wildcard record that has an IP address pointing to your Load Balancer (hostname or VIP). For more information, see the [KB article](#).

### Verifying DNS setup

You must verify the DNS setup to ensure that the app domain DNS hostname points to the Load Balancer.

### Procedure

1. Verify that the app domain DNS hostname has moved from single non-HA ECS Server to the Load Balancer.

Hostname	Expected Roles	DNS
ecs-loadbalancer.example.com	Load Balancer	Resolves to IP of LB host (or VIP). The example uses 10.10.0.99. Both *.apps.ecs.example.com and apps.ecs.example.com resolve to 10.10.0.99.

2. Verify the DNS setup with nslookup.

**Note:** You must verify that a random hostname resolves in the wildcard entry. In this example, Cloudera uses foobar.apps.ecs.example.com as the random name. Both entries should resolve to the same IP address.

For example,

```
$ hosts="apps.ecs.example.com foobar.apps.ecs.example.com"
$ for target in $hosts; do nslookup $target; done

Server: 10.10.xx.xx
Address: 10.10.xx.xx#53

apps.ecs.example.com canonical name = ecs-loadbalancer.example.com.
Name: ecs-loadbalancer.example.com
```

```
Address: 10.10.0.99

Server: 10.10.xx.xx
Address: 10.10.xx.xx#53

Name: foobar.apps.ecs.example.com
Address: 10.10.0.99
```

## Results

DNS setup is verified.

## What to do next

You must now install the Load Balancer.

## Installing Load Balancer

To install the HAProxy Load Balancer, Cloudera uses an example that uses a single instance of HAProxy, configured with round robin balancing and TCP mode. This allows for non-terminating https (https passthrough). The HAProxy service can be configured for High Availability using keepalived.

## Before you begin

You must consult your operating system vendor's documentation for requirements and the install guide for configuring HAProxy with keepalived.

To install a HAProxy Load Balancer, you must ssh into the HAProxy host, install, and then configure HAProxy:

## Procedure

1. `sudo su -`
2. `yum install haproxy -y`
3. `cp /etc/haproxy/haproxy.cfg /etc/haproxy/haproxy.cfg.bak`
4. `cat > /etc/haproxy/haproxy.cfg << EOF`

```
global
```

log	127.0.0.1 local2
chroot	/var/lib/haproxy
pidfile	/var/run/haproxy.pid
user	haproxy
group	haproxy
daemon	

```
defaults
```

mode	tcp
log	global
option	tcplog
option	dontlognull
option	redispatch
retries	3

maxconn	5000
timeout connect	5s

server ecs-server3.example.com 10.10.0.3:443 check

## EOF

systemctl enable haproxy
systemctl restart haproxy
systemctl status haproxy

**Procedure**

1. In Cloudera Manager, select the ECS cluster, then click ECS. Stop the ECS agent running on agent1 and then delete the agent.

ECS-HACluster-01

The screenshot shows the ECS management interface. On the left, there are filter sections for STATUS (Good Health: 5, Stopped: 1), ROLE GROUP, ROLE TYPE, STATE, and HEALTH TEST. The main table lists instances with columns for Status, Role Type, State, Hostname, Commission State, and Role Group. One 'Ecs Agent' instance in the 'Stopped' state is selected.

	Status	Role Type	State	Hostname	Commission State	Role Group
<input type="checkbox"/>	✔	Ecs Agent	Started	[redacted].com	Commissioned	Ecs Agent Default Group
<input type="checkbox"/>	✔	Ecs Agent	Started	[redacted].com	Commissioned	Ecs Agent Default Group
<input checked="" type="checkbox"/>	⊘	Ecs Agent	Stopped	[redacted].com	Commissioned	Ecs Agent Default Group
<input type="checkbox"/>	✔	Ecs Agent	Started	[redacted].com	Commissioned	Ecs Agent Default Group
<input type="checkbox"/>	✔	Ecs Agent	Started	[redacted].com	Commissioned	Ecs Agent Default Group
<input type="checkbox"/>	✔	Ecs Server	Started	[redacted].com	Commissioned	Ecs Server Default Group

2. In ECS, click Add Role Instances.

Add Role Instances to ECS

The 'Assign Roles' dialog box is shown. It includes instructions: 'You can specify the role assignments for your new roles here.' and 'You can also view the role assignments by host: View By Host'. There are two input fields: 'Ecs Server x 1' with 'Select hosts' and 'Ecs Agent x 3' with 'Select hosts'.

3. Add the available host agent1 as an ECS server in the Add Role Instances to ECS pop-up. Click OK.

Add Role Instances to ECS

4. Click Continue.

- Start the new ECS server from the ECS Instances view. For example, start the ECS server on agent1.

- Confirm the node's status from the Web UI or the command line by running the following command:

```
sudo /var/lib/rancher/rke2/bin/kubectl --kubeconfig=/etc/rancher/rke2/rke2.yaml get nodes
```

**Note:** Do not proceed until the node status is Ready. This may take several minutes.

Name	Labels	Ready	CPU requests (cores)	CPU limits (cores)	Memory requests (bytes)	Memory limits (bytes)	Pods	Created
[redacted].com	beta.kubernetes.io/arch: amd64 beta.kubernetes.io/os: linux ecs_role: master	True	4.54 (28.38%)	0.00m (0.00%)	0.00 (0.00%)	0.00 (0.00%)	12 (10.91%)	48 seconds ago

### What to do next

When agent1 is ready, you can promote agent2. To promote agent2, perform steps 1-8 again using agent2.example.com.

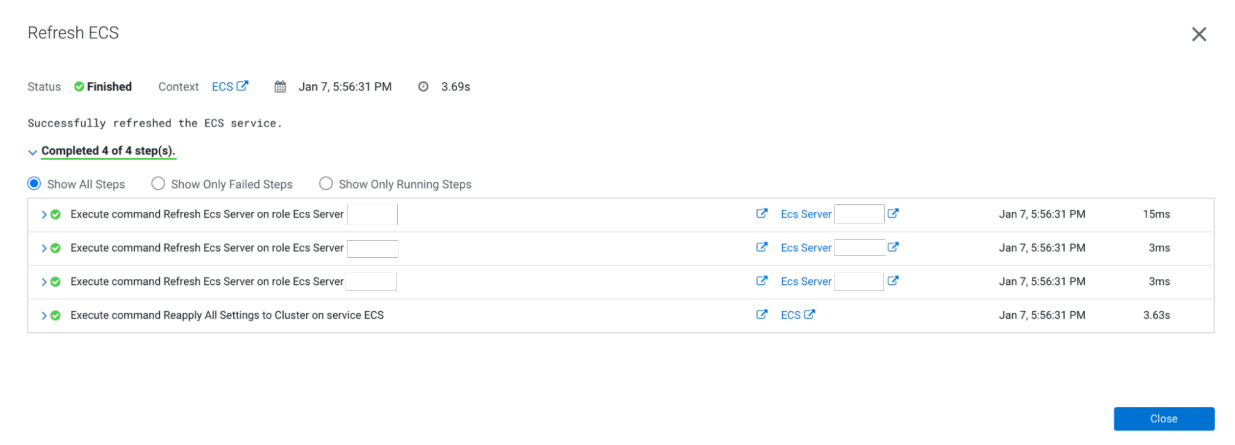

### Refreshing ECS

After all the ECS Agents are promoted to ECS Servers, you must log in to Cloudera Manager and refresh the ECS cluster.

**Procedure**

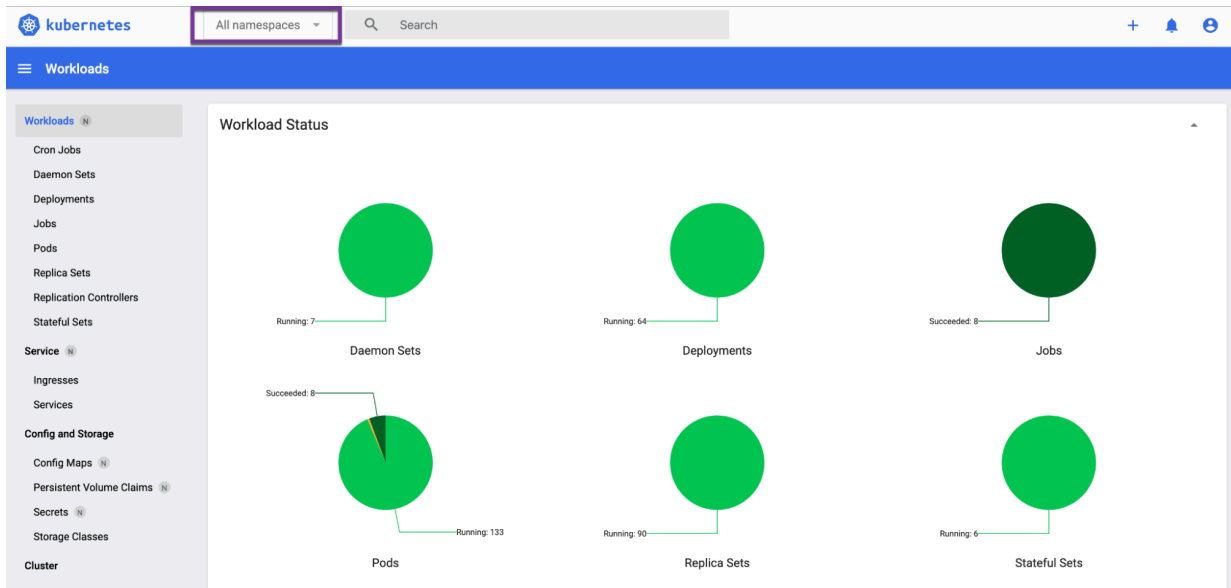

1. Navigate to ECS Cluster >> ECS view >> Actions >> Refresh ECS. This sets the ingress proxy so that all three servers are eligible to process incoming commands.

2. Confirm that all backends of HAProxy display the status UP. This may take several minutes.

Queue		Session rate			Sessions				Bytes			Denied			Errors			Warnings			Status			Server

Ecs Server	✓ 3 Good Health
Hosts	✓ 4 Good Health

#### Results

High Availability is now deployed on your ECS cluster.

## Create an environment-wide backup

Data Recovery Service (DRS), a microservice in CDP Private Cloud Data Services, enables you to create an environment-wide backup of Kubernetes namespaces and resources on Embedded Container Service (ECS) and OpenShift Container Platform (OCP) in CDP Private Cloud Data Services Management Console.

Cloudera recommends that you create a backup of your Kubernetes namespace before a maintenance activity, before you upgrade, or in general, as a best practice.

Role Required: *PowerUser*

By default, the data recovery service is located in the `[***CDP_INSTALLATION_NAMESPACE***]-drs` namespace. For example, if the CDP Private Cloud Data Services installation is located in the `cdp` namespace, the data recovery

service namespace is automatically named *cdp-drs*. If you have multiple CDP Private Cloud Data Services installations (as in OCP), the data recovery service is named accordingly.

When you initiate the backup event in the Backup and Restore Manager for Control Plane, the data recovery service takes a backup of the following resources and data:

- Kubernetes resources associated with the *cdp* namespace and the embedded vault namespaces of the Control Plane in CDP Private Cloud Data Services. The resources include deployment-related information, stateful sets, secrets, and configmaps.
- Data used by the stateful pods, such as the data in the embedded database and Kubernetes persistent volume claim.

The data recovery service can also back up and restore Kubernetes namespaces behind Cloudera Data Warehouse (CDW) entities (for example, Database Catalogs and Virtual Warehouses) on demand.

### Available methods to back up and restore environment

The following methods are available to back up and restore your environment:

#### DRS automatic backups

Starting from CDP Private Cloud Data Services 1.5.4, DRS automatic back ups for Control Plane, Cloudera Data Warehouse (CDW), and Cloudera Data Engineering (CDE) are enabled by default on ECS clusters for new installations or after cluster upgrade to version 1.5.4 or higher.

You can disable this option, if required. You can also configure the external storage in Longhorn for ECS, and then initiate the DRS automatic backup to it. For more information, see *DRS automatic backups*.

**Note:** This functionality is not available for OCP.

**Important:** Automatic backups help ensure that a backup is available. An automatic backup is a consolidated backup of all the Data Services data, so the restore option is not supported for these backups. Automatic backups use a different code path than the Data Service-specific backups and work at the platform level. Service-specific automatic backups are currently not supported.

If data needs to be restored from an automatic backup, you must manually restore using the `kubectl` commands.

For more information, see *DRS automatic backups*.

#### Service-specific CDP CLI options

You can use the CDP CLI options to back up and restore namespaces for Control Plane and CDW.

For the list of available CDP CLI options that you can use for backup and restore purposes, see [drscp](#) and [dw](#).

#### Backup and Restore Manager

You can back up and restore namespaces for Control Plane and CDW on the Backup and Restore Manager page.

To access this page, click the [CDP Private Cloud Data Services Management Console Dashboard Backup Overview View Details](#) option. For more information, see *Access Backup and Restore Manager*.

## Creating backup of Control Plane and restoring it

The Backup and Restore Manager in the CDP Private Cloud Data Services Management Console helps you to backup and restore Kubernetes namespaces and resources on Embedded Container Service (ECS) and OpenShift Container Platform (OCP). You can also restore and delete the backups.

### Before you begin

Ensure that the following prerequisites are complete:

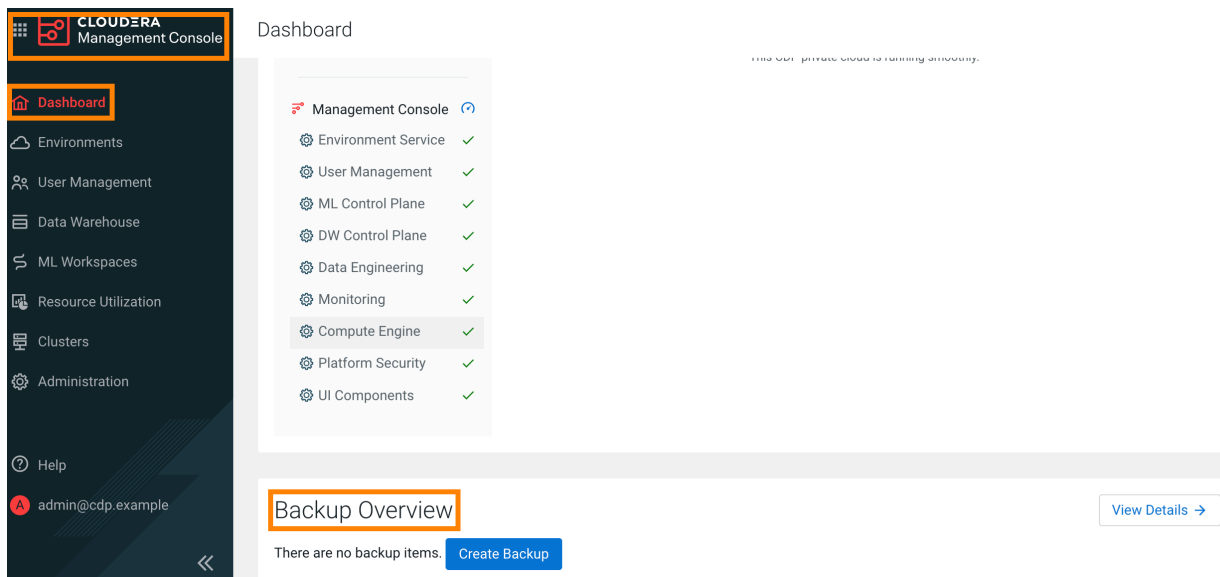

- You must have the *PowerUser* role.
- For OCP, ensure that a *VolumeSnapshotClass* is installed with a CSI driver that matches the CSI driver for the storage class used.

### About this task

The following steps show how to create a backup of the Kubernetes namespaces and resources in the Control Plane, restore a backup, delete a backup, view logs for an event, and sample CDP CLI commands.

### Procedure

1. Go to the **CDP Private Cloud Data Services Management Console Dashboard Backup Overview** section.

2. To create a backup, perform the following steps:

When you create a backup of the Control Plane, Data Recovery Service (DRS) initiates the backup event or job for the chosen backup entity, assigns an ID called *backupCrn* to the backup event, and creates a backup of the

persistent volume claim (PVC) snapshots of the Control Plane namespaces and the backup event's PVC. CRN or Customer Resource Number is the Cloudera-specific identifier provided for an event or job.

- a) Click **Create Backup** in the **Backup Overview** section to create the first backup.

- b) Enter a unique Backup Name and choose the Backup Entity that you want to back up in the **Create Backup** modal window, and then click **Create**.

- c) DRS initiates the backup event and generates a backupCRN which is an automatically assigned ID for the backup event.

The backup event appears in the **Backup Overview** section.

- d) Click **View Details**. The **Backup and Restore Manager** page appears.

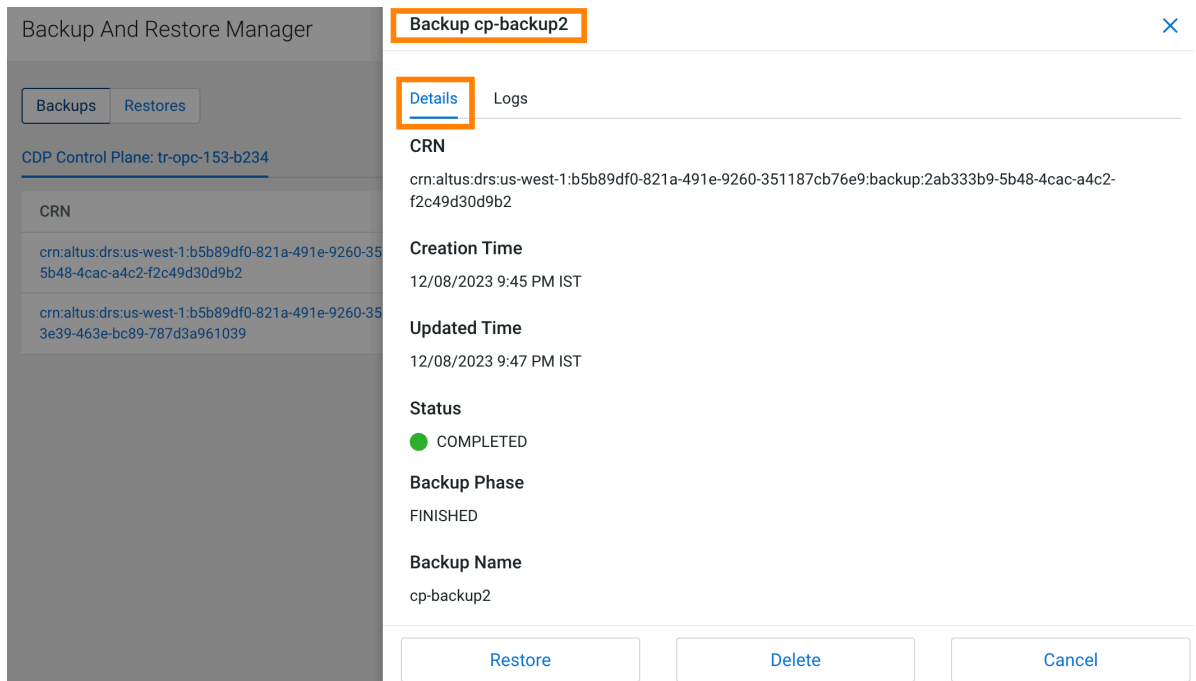

- e) The backupCRN appears as a CRN on the **Backup and Restore Manager** page that you can click to view the backup event details.

f) For subsequent backups, click New Backup on the Backup and Restore Manager page.

g) Click the CRN to view more details about it on the Backup [\*\*\**backup name*\*\*\*] modal window. For example, the following image shows the Backup cp-backup2 modal window.

### 3. To restore a backup, perform the following steps:

When you start the restore a backup, DRS initiates the restore event based on the chosen backup, assigns an ID called `restoreCrn` to the restore event, deletes the existing resources and data, and restores the resources and data from the backup.

**Note:** The restore event has a downtime impact because the PODs and data are recreated. During the restore event, the ECS restore vault is sealed and the POD is down which might appear as a failure in the control plane environment. After the restore event is complete, the vault and POD are auto-recovered and restored. Depending on the number of resources and data, this step might take a maximum of 10 minutes to complete. If the environment does not come up, see the logs to troubleshoot. You can also contact your Cloudera account team.

- a) Go to the **Backup and Restore Manager Backups** tab.
- b) Click **Actions Restore**, and then click **OK** in the **Restore** modal window to acknowledge that you want to restore the backup.

**Important:** Do not delete the `[***CDP_INSTALLATION_NAMESPACE***]-drs` namespace while the restore event is in progress. For example, if the CDP Private Cloud Data Services installation is located in the `cdp` namespace, the `drs` namespace is automatically named `cdp-drs`.

5. To view the logs for a backup or restore event, perform the following steps:
  - a) Go to the Backup and Restore Manager Backups tab.
  - b) Click Actions Logs for the required backup.

Backup And Restore Manager

The screenshot shows the 'Backups' tab in the Backup and Restore Manager. A table lists backup events with columns for CRN, Status, Backup Name, and Creation Time. A modal menu is open for the backup 'cp-backup2', with the 'View Logs' option highlighted.

CRN	Status	Backup Name	Creation Time
crn:altus:drs:us-west-1:b5b89df0-821a-491e-9260-351187cb76e9:backup:2ab333b9-5b48-4cac-a4c2-f2c49d30d9b2	COMPLETED	cp-backup2	12/08/2023 9:45 PM IST
crn:altus:drs:us-west-1:b5b89df0-821a-491e-9260-351187cb76e9:backup:675516e3-3e39-463e-bc89-787d3a961039	COMPLETED	Backup_CP_12-1-23_2200	12/08/2023 9:23:22 AM IST

- c) Click the Logs tab on the modal window.

The screenshot shows the 'Backup cp-backup2' modal window. The 'Logs' tab is selected, displaying the following details:

- CRN:** crn:altus:drs:us-west-1:b5b89df0-821a-491e-9260-351187cb76e9:backup:2ab333b9-5b48-4cac-a4c2-f2c49d30d9b2
- Creation Time:** 12/08/2023 9:45 PM IST
- Updated Time:** 12/08/2023 9:47 PM IST
- Status:** COMPLETED
- Backup Phase:** FINISHED
- Backup Name:** cp-backup2
- Included Namespaces:** (empty)

At the bottom of the modal, there are three buttons: 'Restore', 'Delete', and 'Cancel'.

- d) Alternatively, you can click the CRN for a backup event on the **Backups** tab, or click the CRN for a restore event on the **Restores** tab to open the modal window to view the logs for the event.

6. The following sample CDP CLI options show how to create a backup, restore or delete it, and monitor the progress of the events:

- a) Create a backup using the create-backup CDP CLI option.

The following sample snippet creates a backup named *Backup 2*.

```
cdp.sh --form-factor private --endpoint-url https://console-cpl.apps.shared-os-01.kcloud.cloudera.com drscp create-backup --backup-name "Backup 2"
```

- b) Track the progress of the current status of the specified backupCrn (backup event) using the describe-backup CDP CLI option.

The following sample snippet output shows the current status of the *crn:altus:drs:us-west-1:18be-4c75-8c7f-f32e697dba4a:backup:91193c4f-45f0-949c-13e232f14c9e* backupCrn.

```
cdp.sh --no-verify-tls --endpoint-url https://console-cdp.apps.drs31-1.vpc.cloudera.com --no-verify-tls --form-factor private drscp describe-backup --backup-crn crn:altus:drs:us-west-1:18be-4c75-8c7f-f32e697dba4a:backup:91193c4f-45f0-949c-13e232f14c9e
```

- c) List all the backups using the list-backup CDP CLI option.

The following sample snippet output lists all the available backups.

```
cdp.sh --no-verify-tls --endpoint-url https://console-cdp.apps.lh-lp1-1.vpc.cloudera.com --no-verify-tls --form-factor private drscp list-backup
```

- d) Restore a specific backup, using its CRN, with the restore-backup CDP CLI option.

The following sample snippet restores the backup of *crn:altus:drs:us-west-1:88d84e3c-4c3e-9903-6c388a689690:backup:aebe-96d7-b79d10b64183* CRN.

```
cdp.sh --form-factor private --no-verify-tls --endpoint-url https://console-ocpl.apps.shared-os-01.kcloud.cloudera.com drscp restore-backup --backup-crn crn:altus:drs:us-west-1:88d84e3c-4c3e-9903-6c388a689690:backup:aebe-96d7-b79d10b64183
```

- e) Track the current status of the specified restoreCrn (restore event) using the describe-restore CDP CLI option.

The following sample snippet output shows the current status of the *crn:altus:drs:us-west-1:a70c917a-4be8-927c-d36f3f7db2de:restore:c3b34532-4391-b62d-3f471fae5a40* restoreCrn:

```
cdp.sh --form-factor private --no-verify-tls --endpoint-url https://console-cpl.apps.shared-os-01.kcloud.cloudera.com drscp describe-restore --restore-crn crn:altus:drs:us-west-1:a70c917a-4be8-927c-d36f3f7db2de:restore:c3b34532-4391-b62d-3f471fae5a40
```

For information about all the available CDP CLI options to backup and restore Control Plane and CDW, see [CDP CLI options for Control Plane namespaces](#) and [CDP CLI options for Cloudera Data Warehouse \(CDW\)](#).

To set up a CDP client to run the CDP CLI commands, see [CDP Private Cloud CLI](#).

## Troubleshooting DRS

The troubleshooting scenarios in this topic help you to troubleshoot issues that might appear for DRS in the Control Plane. The “Backup and Restore Manager” in CDP Private Cloud Data Services Management Console leverages the Data Recovery Service (DRS) capabilities to backup and restore Kubernetes namespaces and resources.

## CDP Control Plane UI or the Backup and Restore Manager becomes inaccessible after a failed restore event?

### Problem

CDP Control Plane UI does not come up or the Backup and Restore Manager (or drscp options) becomes inaccessible after a failed restore event.

### Cause

Sometimes, some configurations take more time to restore. For example, in a shared cluster (OCP) that is heavily loaded, the restore event might surpass the set timeout limit. In this scenario, you can either wait or rerun the restore event again.

**Tip:** Run the restore event for such scenarios during non-peak hours.

### Solution

You can perform one of the following steps after a failed restore event:

- Wait for a minimum of 15 minutes. This might resolve the issue automatically if the issue was caused due to timeout. You can verify this in the logs.
- Run restore again. This might resolve the issue if it was temporary such as, restore event during cluster maintenance.

If the Control Plane is not restored successfully even after you follow the steps, contact Cloudera Support for further assistance.

## Timeout error appears in Backup and Restore Manager

### Problem

A timeout error appears in the Backup and Restore Manager (or drscp options) during a restore event.

### Solution

When the restore event crosses the time set in the `POD_CREATION_TIMEOUT` environment property of the `cdp-release-thunderhead-drsprovider` deployment in the `drs` namespace, a timeout error appears. By default, the property is set to 900 seconds. In this scenario, you must manually verify whether the pods are up or not.

## Stale configurations in Cloudera Manager after a restore event

### Cause

This scenario appears when you take a backup of the CDP Private Cloud Data Services Control Plane, upgrade Data Services, and then perform a restore. During the upgrade process, new parcels are activated and configurations in Cloudera Manager might have changed.

### Solution

It is recommended that you restart Cloudera Manager after the upgrade process is complete and then initiate the restore event.

## Timeout error during backup of OCP clusters

### Problem

"The execution of the sync command has timed out" error appears during a backup event for OCP clusters.

### Cause

This scenario is observed when the cluster is heavily used and the backup event is initiated during peak hours.

### Solution

You can restart the nodes, this causes the disk to unmount and forces the operating system to write any data in its cache to the disk. After the restart is complete, initiate another backup. If any warnings appear, scrutinize to verify whether there are any dire warnings, otherwise the generated backup is safe to use. The only drawback in this scenario is the downtime impact, that is the time taken to back up the OCP clusters is longer than usual. Therefore, it is recommended that you back up the clusters during non-peak hours.

If the sync errors continue to appear, contact your IT department to check whether there is an issue with the storage infrastructure which might be preventing the sync command from completing on time.

## Managing certificates

### Adjusting the expiration time of ECS cluster certificates

The RKE Kubernetes, Vault, and ECS webhook certificate expiration times are set to one year by default. To avoid certificate expiration errors, you may want to extend the expiration times.

#### About this task

**Note:**

This topic only applies to internal certificates within ECS. It does not apply to the ingress controller certificate.

- These steps describe how to adjust the expiration time of internal cluster certificates in an existing ECS cluster.
- For a new cluster, if the nodes have been added to Cloudera Manager before creating the ECS cluster, you can edit the `cluster_signing_duration` configuration property in Cloudera Manager before creating the ECS cluster.

#### Adjusting the expiration time of the RKE Kubernetes cluster certificate

1. In Cloudera Manager, select the ECS cluster, then click ECS.
2. Click the Configuration tab, then use the Search box to locate the `cluster_signing_duration` configuration property.

- The `cluster_signing_duration` configuration property sets the expiration time for the RKE Kubernetes, Vault, and ECS webhook certificates, and is set to 1 year (365 days) by default. In the example below, the certificate expiration has been reset to 5 years (1825 days):

The screenshot shows the Cloudera Manager interface for configuring the `cluster_signing_duration` property. The property is set to 1825 days for the ECS (Service-Wide) scope. The interface includes a sidebar with navigation options like Clusters, Hosts, Diagnostics, Audits, Charts, Replication, Administration, and Data Services. The main content area shows the configuration details for the selected property, including filters for scope, category, and status. A 'Save Changes' button is visible at the bottom right.

- Click Save Changes.
- On the ECS Cluster landing page, click Actions > Refresh Cluster.
- After the Refresh is complete, click Actions > Rolling Restart.
- After the restart is complete, the certificate expiration time is reset to the new value. You can also use the CLI to verify the new certificate expiration setting:

```

### Adjusting the expiration time of the Vault certificate

1. In Cloudera Manager, select the ECS cluster, then click ECS.
2. Click the Configuration tab, then use the Search box to locate the `cluster_signing_duration` configuration property.

- The `cluster_signing_duration` configuration property sets the expiration time for the RKE Kubernetes, Vault, and ECS webhook certificates, and is set to 1 year (365 days) by default. In the example below, the certificate expiration has been reset to 5 years (1825 days):

The screenshot shows the Cloudera Manager interface for configuring the `cluster_signing_duration` property. The interface includes a sidebar with navigation options like Clusters, Hosts, Diagnostics, Audits, Charts, Replication, Administration, and Data Services. The main content area shows the configuration details for the cluster\_signing\_duration property, including a search bar, filters, and a 'Save Changes' button.

Filters:

Cluster Signing Duration: ECS (Service-Wide) Undo

cluster\_signing\_duration: 1825

1 Edited Value Reason for change: Modified Cluster Signing Duration Save Changes(CTRL+S)

- Click Save Changes.
- Contact Cloudera support and ask them to provide you with a copy of the `rotate-vault-cert.sh` file.
- Copy the `rotate-vault-cert.sh` file to the ECS master host. Set `JAVA_HOME` if needed.
- Run the following command:
 

```
./rotate-vault-cert.sh APP_DOMAIN
```
- Unseal Vault.
- Restart all of the pods in the CDP namespace.
- If you are using a default self-signed ingress controller certificate, update the ingress controller certificate (follow the steps in the script output).
- You can use the CLI to verify the new certificate expiration setting:

```

### Adjusting the expiration time of the ECS webhook certificate

1. In Cloudera Manager, select the ECS cluster, then click ECS.
2. Click the Configuration tab, then use the Search box to locate the cluster\_signing\_duration configuration property.

- The `cluster_signing_duration` configuration property sets the expiration time for the RKE Kubernetes, Vault, and ECS webhook certificates, and is set to 1 year (365 days) by default. In the example below, the certificate expiration has been reset to 5 years (1825 days):

The screenshot shows the Cloudera Manager interface for configuring the `cluster_signing_duration` property. The interface includes a sidebar with navigation options like Clusters, Hosts, Diagnostics, Audits, Charts, Replication, Administration, and Data Services. The main content area shows the configuration details for the `cluster_signing_duration` property, including a search bar, filters, and a 'Save Changes' button.

Filters:

- SCOPE
  - ECS (Service-Wide) 1
  - Ecs Agent 0
  - Ecs Server 0
- CATEGORY
  - Main 1
  - Advanced 0
  - Monitoring 0
  - Performance 0
  - Ports and Addresses 0
  - Resource Management 0
  - Security 0
- STATUS
  - Error 0
  - Warning 0
  - Edited 1
  - Non-Default 1
  - Include Overrides 0

Cluster Signing Duration: ECS (Service-Wide) Undo

`cluster_signing_duration` 1825

1 Edited Value Reason for change: Modified Cluster Signing Duration Save Changes(CTRL+S)

- Click Save Changes.
- Contact Cloudera support and ask them to provide you with a copy of the `rotate-webhook-cert.sh` file.
- Copy the `rotate-webhook-cert.sh` file to the ECS master host.
- Run the following command:
 

```
./rotate-webhook-cert.sh APP_DOMAIN
```
- Check for any pods in the Pending state whose status shows that they cannot tolerate the `node-role.kubernetes.io/control-plane` toleration. Restart those pods.
- You can use the CLI to verify the new certificate expiration setting:

```
root      49076   48970   2 16:49 ?          00:00:10 kube-controller-manage
r
--flex-volume-plugin-dir=/var/lib/kubelet/volumeplugins --terminated-pod-
gc-threshold=1000 --permit-port-sharing=true
--allocate-node-cidrs=true --authentication-kubeconfig=/var/lib/rancher/
rke2/server/cred/controller.kubeconfig
--authorization-kubeconfig=/var/lib/rancher/rke2/server/cred/controller.
kubeconfig --bind-address=127.0.0.1
--cluster-cidr=10.42.0.0/16 --cluster-signing-duration=43800h
<snip!>
