Cloudera Manager Health Tests

This section provides information on health tests supported by Cloudera Manager.

This section provides information on health tests supported by Cloudera Manager.

> **Note:** Cloudera Manager provides monitoring of network port information at the Operating System level. The underlying network issues from the upper level of Big Data software cannot be resolved from the Cloudera Manager point of view. The frame error, if seen, requires you to contact the relevant network team for inspection and further action. Note that this kind of frame errors are typically related to hardware, such as server network port, network cable of related lines, switch ports, and pertinent items.
>
> For more information, refer to these KB articles - Cloudera Manager Monitoring Frame Error Bonded Network and CDH and Network Frame Errors.

There are two types of health tests:

- Pass-fail tests - there are two types:

  - Compare a property to a yes-no value. For example, whether a service or role started as expected, a DataNode is connected to its NameNode, or a TaskTracker is (or is not) blocked.
  - Exercise a service lightly to confirm it is working and responsive. HDFS (NameNode role), HBase, and ZooKeeper services perform these tests, which are referred to as "canary" tests.

  Both types of pass-fail tests result in the health reported as being either Good or Bad.

- Metric tests - compare a property to a numeric value. For example, the number of file descriptors in use, the amount of disk space used or free, how much time spent in garbage collection, or how many pages were swapped to disk in the previous 15 minutes. In these tests the property is compared to a threshold that determine whether everything is Good, (for example, plenty of disk space available), whether it is Concerning (disk space getting low), or is Bad (a critically low amount of disk space).

By default most health tests are enabled and (if appropriate) configured with reasonable thresholds. You can modify threshold values by editing the monitoring properties under the entity's Configuration tab. You can also enable or disable individual or summary health tests, and in some cases specify what should be included in the calculation of overall health for the service, role instance, or host.

> **Important:** Activity Monitor feature is not supported with Cloudera Manager. Note that when you load a backup of Cloudera Manager, you could come across the configuration settings of Activity Monitor.

Active Database Health Tests

Active Database Audit Pipeline Test

This Active Database health test checks that the Auditing for the Active Database role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of Active Database process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the Active Database host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check Active Database monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

mgmt_navigator_failure_window

Default Value

20

Unit(s)

MINUTES

Navigator Audit Failure Thresholds

Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

mgmt_navigator_failure_thresholds

Default Value

critical:any, warning:never

Unit(s)

BYTES

Navigator Audit Pipeline Health Check

Description

Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

mgmt_navigator_status_check_enabled

Default Value

true

Unit(s)

no unit

Active Database File Descriptors

This Active Database health test checks that the number of file descriptors used does not rise above some percentage of the Active Database file descriptor limit. A failure of this health test may indicate a bug in either Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor Monitoring Thresholds Active Database monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds

Description

The health test thresholds of the number of file descriptors used. Specified as a percentage of file descriptor limit.

Template Name

db_active_fd_thresholds

Default Value

critical:70.0, warning:50.0

Unit(s)

PERCENT

Active Database Host Health

This Active Database health test factors in the health of the host upon which the Active Database is running. A failure of this test means that the host running the Active Database is experiencing some problem. See that host's status page for more details.This test can be enabled or disabled using the Active Database Host Health Test Active Database monitoring setting.

Short Name: Host Health

Active Database Host Health Test

Description

When computing the overall Active Database health, consider the host's health.

Template Name

db_active_host_health_enabled

Default Value

true

Unit(s)

no unit

Active Database Process Status

This Active Database health test checks that the Cloudera Manager Agent on the Active Database host is heart beating correctly and that the process associated with the Active Database role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Active Database process, a lack of connectivity to the Cloudera Manager Agent on the Active Database host, or a problem with the Cloudera Manager Agent. This test can fail either because the Active Database has crashed or because the Active Database will not start or stop in a timely fashion. Check the Active Database logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Active Database host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Active Database host, or look in the Cloudera Manager Agent logs on the Active Database host for more details. This test can be enabled or disabled using the Active Database Process Health Test Active Database monitoring setting.

Short Name: Process Status

Active Database Process Health Test

Description

Enables the health test that the Active Database's process state is consistent with the role configuration

Template Name

db_active_scm_health_enabled

Default Value

true

Unit(s)

no unit

Active Database Swap Memory Usage

This Active Database health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

```
process_swap_memory_thresholds
```

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

Active Database Swap Memory Usage Rate Beta

This Active Database health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

```
process_swap_memory_rate_thresholds
```

Default Value

critical:never, warning:never

Unit(s)

BYTES

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

```
process_swap_memory_rate_window
```

Default Value

5

Unit(s)

MINUTES

Active Database Unexpected Exits

This Active Database health test checks that the Active Database has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates

whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Active Database monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

> The period to review when computing unexpected exits.

Template Name

Activity Monitor - Unsupported Since 7.0.0 Cloudera Manager Descriptor Age

This is a Activity Monitor - Unsupported Since 7.0.0 health test that checks if the Cloudera Manager descriptor has been refreshed recently. The Cloudera Manager descriptor is used to pass configuration information from the Cloudera Manager Server to the Activity Monitor - Unsupported Since 7.0.0. If the descriptor becomes stale, Activity Monitor - Unsupported Since 7.0.0 operation may be impacted because the Activity Monitor - Unsupported Since 7.0.0 will receive information about new hosts, roles, and services, or changes to existing hosts, roles, and services. A stale descriptor usually indicates problems communicating with the Cloudera Manager Server but can also indicate performance problems or a bug. Consult the Activity Monitor - Unsupported Since 7.0.0 log and the Cloudera Manager Server log for more information. This test can be configured using the Cloudera Manager Descriptor Age Thresholds Cloudera Manager Activity Monitor - Unsupported Since 7.0.0 setting.

Short Name: Cloudera Manager Descriptor Age

Cloudera Manager Descriptor Age Thresholds

Description

The health test thresholds for monitoring the time since the Cloudera Manager descriptor was last refreshed.

Template Name

scm_descriptor_age_thresholds

Default Value

critical:120000.0, warning:60000.0

Unit(s)

Activity Monitor - Unsupported Since 7.0.0 Pause Duration

This Activity Monitor - Unsupported Since 7.0.0 health test checks that the Activity Monitor - Unsupported Since 7.0.0 threads are not experiencing long scheduling pauses. The test uses a pause monitoring thread in the Activity Monitor - Unsupported Since 7.0.0 that tracks scheduling delay by noting if it is run on its requested schedule. If the thread is not run on its requested schedule, the delay is noted and considered pause time. The health test checks that no more than some percentage of recent time is spent paused. A failure of this health test may indicate that the Activity Monitor - Unsupported Since 7.0.0 is not getting enough CPU resources, or that it is spending too much time doing garbage collection. Inspect the Activity Monitor - Unsupported Since 7.0.0 logs for any pause monitor output and check garbage collection metrics exposed by the Activity Monitor - Unsupported Since 7.0.0. This test can be configured using the Pause Duration Thresholds and Pause Duration Monitoring Period Activity Monitor - Unsupported Since 7.0.0 monitoring settings.

Short Name: Pause Duration

Pause Duration Monitoring Period
Description

Activity Monitor - Unsupported Since 7.0.0 Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate a problem with the web server of the Activity Monitor - Unsupported Since 7.0.0, a misconfiguration of the Activity Monitor - Unsupported Since 7.0.0, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the Activity Monitor - Unsupported Since 7.0.0 for more detail. If the test failure message indicates a communication problem, the Cloudera Manager Agent's HTTP requests to the Activity Monitor - Unsupported Since 7.0.0's web server are failing or timing out. If the test's failure message indicates an unexpected response, the Activity Monitor - Unsupported Since 7.0.0's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection Activity Monitor - Unsupported Since 7.0.0 monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Description

Enables the health test that the Cloudera Manager Agent can successfully contact and gather metrics from the web server.

Template Name

activitymonitor_web_metric_collection_enabled

Default Value

true

Unit(s)

no unit

Web Metric Collection Duration

Description

The health test thresholds on the duration of the metrics request to the web server.

MILLISECONDS

Alert Publisher Health Tests

Alert Publisher Audit Pipeline Test

This Alert Publisher health test checks that the Auditing for the Alert Publisher role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of Alert Publisher process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the Alert Publisher host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check Alert Publisher monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

mgmt_navigator_failure_window

Default Value

20

Unit(s)

MINUTES

Navigator Audit Failure Thresholds

Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

mgmt_navigator_failure_thresholds

Atlas Health Tests

Atlas Server Health

This is a Atlas service-level health test that checks that enough of the Atlas Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Atlas Servers falls below a warning threshold, expressed as a percentage of the total number of Atlas Servers. The test returns "Bad" health if the number of healthy and "Concerning" Atlas Servers falls below a critical threshold, expressed as a percentage of the total number of Atlas Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Atlas Servers, this test would return "Good" health if 95 or more Atlas Servers have good health. This test would return "Concerning" health if at least 90 Atlas Servers have either "Good" or "Concerning" health. If more than 10 Atlas Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Atlas Servers. Check the status of the individual Atlas Servers for more information. This test can be configured using the Atlas Atlas service-wide monitoring setting.

Short Name: Atlas Server Health

Healthy Atlas Server Monitoring Thresholds

Description

The health test thresholds of the overall Atlas Server health. The check returns "Concerning" health if the percentage of "Healthy" Atlas Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Atlas Servers falls below the critical threshold.

Template Name

Authentication Server Load Balancer Log Directory Free Space

This Authentication Server Load Balancer health test checks that the filesystem containing the log directory of this Authentication Server Load Balancer has sufficient free space. This test can be configured using the Log Directory Free Space Monitoring Absolute Thresholds and Log Directory Free Space Monitoring Percentage Thresholds Authentication Server Load Balancer monitoring settings.

Short Name: Log Directory Free Space

Log Directory Free Space Monitoring Absolute Thresholds

Description

> The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory.

Template Name

> `log_directory_free_space_absolute_thresholds`

Default Value

> critical:5.36870912E9, warning:1.073741824E10

Unit(s)

> BYTES

Log Directory Free Space Monitoring Percentage Thresholds

Description

> The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a Log Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

> `log_directory_free_space_percentage_thresholds`

Default Value

> critical:never, warning:never

Unit(s)

> PERCENT

Authentication Server Load Balancer Process Status

This Authentication Server Load Balancer health test checks that the Cloudera Manager Agent on the Authentication Server Load Balancer host is heart beating correctly and that the process associated with the Authentication Server Load Balancer role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Authentication Server Load Balancer process, a lack of connectivity to the Cloudera Manager Agent on the Authentication Server Load Balancer host, or a problem with the Cloudera Manager Agent. This test can fail either because the Authentication Server Load Balancer has crashed or because the Authentication Server Load Balancer will not start or stop in a timely fashion. Check the Authentication Server Load Balancer logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Authentication Server Load Balancer host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on

the Authentication Server Load Balancer host, or look in the Cloudera Manager Agent logs on the Authentication Server Load Balancer host for more details. This test can be enabled or disabled using the Authentication Server Load Balancer Process Health Test Authentication Server Load Balancer monitoring setting.

Short Name: Process Status

Authentication Server Load Balancer Process Health Test

Description

Enables the health test that the Authentication Server Load Balancer's process state is consistent with the role configuration

Template Name

auth_load_balancer_scm_health_enabled

Default Value

true

Unit(s)

no unit

Authentication Server Load Balancer Swap Memory Usage

This Authentication Server Load Balancer health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

process_swap_memory_thresholds

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

Authentication Server Load Balancer Swap Memory Usage Rate Beta

This Authentication Server Load Balancer health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

process_swap_memory_rate_thresholds

Default Value

        critical:never, warning:never

Unit(s)

        BYTES

Swap Memory Usage Rate Window

Description

        The period to review when computing unexpected swap memory usage change of the process.

Template Name

        `process_swap_memory_rate_window`

Default Value

        5

Unit(s)

        MINUTES

Authentication Server Load Balancer Unexpected Exits

This Authentication Server Load Balancer health test checks that the Authentication Server Load Balancer has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Authentication Server Load Balancer monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

        The period to review when computing unexpected exits.

Template Name

        `unexpected_exits_window`

Default Value

        5

Unit(s)

        MINUTES

Unexpected Exits Thresholds

Description

        The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

        `unexpected_exits_thresholds`

Default Value

        critical:any, warning:never

Unit(s)

        no unit

Authentication Service Health Tests

Authentication Service Authentication Server Health

This is a Authentication Service service-level health test that checks that enough of the Authentication Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Authentication Servers falls below a warning threshold, expressed as a percentage of the total number of Authentication Servers. The test returns "Bad" health if the number of healthy and "Concerning" Authentication Servers falls below a critical threshold, expressed as a percentage of the total number of Authentication Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Authentication Servers, this test would return "Good" health if 95 or more Authentication Servers have good health. This test would return "Concerning" health if at least 90 Authentication Servers have either "Good" or "Concerning" health. If more than 10 Authentication Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Authentication Servers. Check the status of the individual Authentication Servers for more information. This test can be configured using the Authentication Service Authentication Service service-wide monitoring setting.

Short Name: Authentication Server Health

Healthy Authentication Server Monitoring Thresholds

Description

The health test thresholds of the overall Authentication Server health. The check returns "Concerning" health if the percentage of "Healthy" Authentication Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Authentication Servers falls below the critical threshold.

Template Name

`auth_authservers_healthy_thresholds`

Default Value

critical:51.0, warning:99.0

Cloudera Management Service Certificate Expiration

This health test checks the expiry time of the TLS certificate for the Cloudera Manager Server. This test can be configured using the Cloudera Manager TLS Certificate Expiry Thresholds Cloudera Manager Service monitoring setting. This test alerts when the certificate is close to expiry.

Short Name: Certificate Expiration

Cloudera Manager TLS Certificate Expiry Thresholds

Description

The health test thresholds for monitoring the certificate of Cloudera Manager Server.

Template Name

`mgmt_certificate_expiry_thresholds`

Default Value

critical:7.0, warning:60.0

Unit(s)

DAYS

Cloudera Management Service Cloudera Manager Server Clock Offset

This is a health test that checks if the clock offset between Cloudera Manager Server and Service Monitor is too large. This test can be configured using the Cloudera Manager Server Clock Offset Thresholds Cloudera Manager Service monitoring setting. This test calculates clock offset using the timestamp int messages that Cloudera Manager Server sends to Service Monitor and the timestamp when Service Monitor gets the messages. Check the NTP configuration on both Cloudera Manager Server and Service Monitor machines if this test fails.

Short Name: Cloudera Manager Server Clock Offset

Cloudera Manager Server Clock Offset Thresholds

Description

The health test thresholds for monitoring the clock offset between the Cloudera Manager Server and the Service Monitor.

Template Name

`mgmt_clock_offset_with_smon_thresholds`

Default Value

critical:60000.0, warning:30000.0

Unit(s)

MILLISECONDS

Cloudera Management Service Cloudera Manager Server Cluster Availability

This health test checks the Cloudera Manager Server clusters availability. This test alerts when Cloudera Manager Server cluster does not have enough healthy nodes.

Short Name: Cloudera Manager Server Cluster Availability

Cloudera Manager Server Cluster Availability Threshold Percents

Description

> The health test thresholds for the Cloudera Manager Server Cluster Availability. Specify the minimum required percent of healthy and running CM cluster nodes.

Template Name

> `mgmt_cm_ha_availability_thresholds`

Default Value

> critical:never, warning:never

Unit(s)

Cloudera Management Service Cloudera Manager Server Heap Size

This Cloudera Manager Server health test checks that the Cloudera Manager Server heap size is adequate for the it. Consider increasing the heap when it is in critical state A failure of this health test may indicate that the Cloudera Manager Server is not getting the optimal heap size. Inspect the Cloudera Manager Server logs for any pause monitor output, check garbage collection metrics exposed by the Cloudera Manager Server. This test can be configured using the Cloudera Management Service settings.

Short Name: Cloudera Manager Server Heap Size

Cloudera Manager Server Heap Size Thresholds

Description

> The health test thresholds for the Cloudera Manager Server heap usage.

Template Name

> `mgmt_heap_size_thresholds`

Default Value

> critical:95.0, warning:90.0

Unit(s)

> PERCENT

Cloudera Management Service Cloudera Manager Server Pause Duration

This health test checks that the Cloudera Manager Server threads are not experiencing long scheduling pauses. The test uses a pause monitoring thread in the Cloudera Manager Server that tracks scheduling delay by noting if it is run on its requested schedule. If the thread is not run on its requested schedule, the delay is noted and considered pause time. The health test checks that no more than some percentage of recent time is spent paused. A failure of this health test may indicate that the Cloudera Manager Server is not getting enough CPU resources, or that it is spending too much time doing garbage collection. Inspect the Cloudera Manager Server logs for any pause monitor output and check garbage collection metrics exposed by the Service Monitor. This test can be configured using the Cloudera Manager Server Pause Duration Thresholds and Cloudera Manager Server Pause Duration Monitoring Period Cloudera Manager Server settings.

Short Name: Cloudera Manager Server Pause Duration

Cloudera Manager Server Pause Duration Monitoring Period

Description

The period to review when computing the moving average of extra time the pause monitor spent
paused.

Template Name

`mgmt_pause_duration_window`

Default Value

5

Unit(s)

MINUTES

Cloudera Manager Server Pause Duration Thresholds

Cruise Control Server Unexpected Exits

This Cruise Control Server health test checks that the Cruise Control Server has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Cruise Control Server monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

> The period to review when computing unexpected exits.

Template Name

> `unexpected_exits_window`

Default Value

> 5

Unit(s)

> MINUTES

Unexpected Exits Thresholds

Description

> The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

Default Value

> critical:any, warning:never

Unit(s)

> no unit

DOCKER Health Tests

DOCKER Docker Registry Canary

Check Docker Registry for problems.

Short Name: Docker Registry Canary

DOCKER Docker Server Health

This is a DOCKER service-level health test that checks that enough of the Docker Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Docker Servers falls below a warning threshold, expressed as a percentage of the total number of Docker Servers. The test returns "Bad" health if the number of healthy and "Concerning" Docker Servers falls below a critical threshold, expressed as a percentage of the total

number of Docker Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Docker Servers, this test would return "Good" health if 95 or more Docker Servers have good health. This test would return "Concerning" health if at least 90 Docker Servers have either "Good" or "Concerning" health. If more than 10 Docker Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Docker Servers. Check the status of the individual Docker Servers for more information. This test can be configured using the DOCKER DOCKER service-wide monitoring setting.

Short Name: Docker Server Health

Healthy Docker Server Monitoring Thresholds

Description

The health test thresholds of the overall Docker Server health. The check returns "Concerning" health if the percentage of "Healthy" Docker Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Docker Servers falls below the critical threshold.

Template Name

`docker_docker_servers_healthy_thresholds`

Default Value

critical:90.0, warning:95.0

Data Analytics Studio Eventprocessor Health Tests

Data Analytics Studio Eventprocessor Audit Pipeline Test

This Data Analytics Studio Eventprocessor health test checks that the Auditing for the Data Analytics Studio Eventprocessor role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of Data Analytics Studio Eventprocessor process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the Data Analytics Studio Eventprocessor host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check Data Analytics Studio Eventprocessor monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

DataNode Block Count

This is a DataNode health test that checks for whether the DataNode has too many blocks. Having too many blocks on a DataNode may affect the DataNode's performance. A DataNode with a large number of blocks will require a larger java heap and may experience longer garbage collection pauses. Additionally, a large number of blocks may be an indicator of the presence of many small files. HDFS is not optimized for dealing with many small files, and processing times may suffer when operating across many small files. If only some DataNodes have a high number of blocks, running the HDFS Rebalance command may address this issue by moving data between DataNodes. If the HDFS Rebalance command reports the cluster as balanced without fixing the block imbalance then the problem is related to the presence of many small files. Consult the HDFS documentation for best-practices on addressing this issue. If many small files is not a concern for your use case, consider disabling this health test. If all DataNodes have a high number of blocks and the issue is not related to small files, additional DataNodes should be added. This test can be configured using the DataNode Block Count Thresholds DataNode monitoring setting.

DataNode Data Directory Free Space Monitoring Percentage Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's DataNode Data Directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a DataNode Data Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

`datanode_data_directories_free_space_percentage_thresholds`

Default Value

critical:never, warning:never

Unit(s)

PERCENT

DataNode File Descriptors

This DataNode health test checks that the number of file descriptors used does not rise above some percentage of the DataNode file descriptor limit. A failure of this health test may indicate a bug in either Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor Monitoring Thresholds DataNode monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds

Description

The health test thresholds of the number of file descriptors used. Specified as a percentage of file descriptor limit.

Template Name

datanode_fd_thresholds

Default Value

critical:70.0, warning:50.0

Unit(s)

PERCENT

DataNode Free Space

This is a DataNode health test that checks that the amount of free space available for HDFS block data on the DataNode does not fall below some percentage of total configured capacity of the DataNode. A failure of this health test may indicate a capacity planning problem. Try adding more disk capacity and additional data directories to the DataNode, or add additional DataNodes and take steps to rebalance your HDFS cluster. This test can be configured using the DataNode Free Space Monitoring Thresholds DataNode monitoring setting.

Short Name: Free Space

DataNode Free Space Monitoring Thresholds

Description

The health test thresholds of free space in a DataNode. Specified as a percentage of the capacity on the DataNode.

Template Name

datanode_free_space_thresholds

Default Value

critical:10.0, warning:20.0

Unit(s)

PERCENT

DataNode Heap Dump Directory Free Space

This DataNode health test checks that the filesystem containing the heap dump directory of this DataNode has sufficient free space. This test can be configured using the Heap Dump Directory Free Space Monitoring Absolute Thresholds and Heap Dump Directory Free Space Monitoring Percentage Thresholds DataNode monitoring settings.

Short Name: Heap Dump Directory Free Space

Heap Dump Directory Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's heap dump directory.

Template Name

heap_dump_directory_free_space_absolute_thresholds

PERCENT

DataNode NameNode Connectivity

This is a DataNode health test that checks that all the running NameNodes in the HDFS service consider the DataNode alive. A failure of this health test may indicate that the DataNode is having trouble communicating with some or all NameNodes in the service. Look in the DataNode logs for more details. This test can be enabled or disabled using the DataNode Connectivity Health Test DataNode monitoring setting. The DataNode Connectivity Tolerance at Startup DataNode monitoring setting and the Health Test Startup Tolerance NameNode monitoring setting can be used to control the test's tolerance windows around DataNode and NameNode restarts respectively.

Short Name: NameNode Connectivity

DataNode Connectivity Health Test

Description

Enables the health test that verifies the DataNode is connected to the NameNode

Template Name

`datanode_connectivity_health_enabled`

Default Value

true

Unit(s)

no unit

DataNode Connectivity Tolerance at Startup

Description

The amount of time to wait for the DataNode to fully start up and connect to the NameNode before enforcing the connectivity check.

Template Name

`datanode_connectivity_tolerance`

Default Value

180

Unit(s)

SECONDS

Health Test Startup Tolerance

Description

The amount of time allowed after this role is started that failures of health tests that rely on communication with this role will be tolerated.

Template Name

> namenode_startup_tolerance

Default Value

> 5

Unit(s)

> MINUTES

DataNode Pause Duration

This DataNode health test checks that the DataNode threads are not experiencing long scheduling pauses. The test uses a pause monitoring thread in the DataNode that tracks scheduling delay by noting if it is run on its requested schedule. If the thread is not run on its requested schedule, the delay is noted and considered pause time. The health test checks that no more than some percentage of recent time is spent paused. A failure of this health test may indicate that the DataNode is not getting enough CPU resources, or that it is spending too much time doing garbage collection. Inspect the DataNode logs for any pause monitor output and check garbage collection metrics exposed by the DataNode. This test can be configured using the Pause Duration Thresholds and Pause Duration Monitoring Period DataNode monitoring settings.

Short Name: Pause Duration

Pause Duration Monitoring Period

Description

> The period to review when computing the moving average of extra time the pause monitor spent paused.

Template Name

> datanode_pause_duration_window

Default Value

> 5

Unit(s)

> MINUTES

Pause Duration Thresholds

Description

> The health test thresholds for the weighted average extra time the pause monitor spent paused. Specified as a percentage of elapsed wall clock time.

Template Name

> datanode_pause_duration_thresholds

DataNode Process Status

This DataNode health test checks that the Cloudera Manager Agent on the DataNode host is heart beating correctly and that the process associated with the DataNode role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the DataNode process, a lack of connectivity to the Cloudera Manager Agent on the DataNode host, or a problem with the Cloudera Manager Agent. This test can fail either because the DataNode

has crashed or because the DataNode will not start or stop in a timely fashion. Check the DataNode logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the DataNode host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the DataNode host, or look in the Cloudera Manager Agent logs on the DataNode host for more details. This test can be enabled or disabled using the DataNode Process Health Test DataNode monitoring setting.

Short Name: Process Status

DataNode Process Health Test

Description

Enables the health test that the DataNode's process state is consistent with the role configuration

Template Name

datanode_scm_health_enabled

Default Value

true

Unit(s)

no unit

DataNode Swap Memory Usage

This DataNode health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

process_swap_memory_thresholds

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

DataNode Swap Memory Usage Rate Beta

This DataNode health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

process_swap_memory_rate_thresholds

Default Value

> critical:never, warning:never

Unit(s)

> BYTES

Swap Memory Usage Rate Window

Description

> The period to review when computing unexpected swap memory usage change of the process.

DataNode Transceiver Usage

This is a DataNode health test that checks for whether the DataNode transceivers usage is nearing the configured transceivers limit. A transceiver is a thread used to transfer data into or out of the DataNode. If a DataNode hits its transceivers limit, HDFS reads and writes begin to fail. This test can be configured using the DataNode Transceivers Usage Thresholds DataNode monitoring setting. The Maximum Number of Transfer Threads DataNode setting controls the DataNode transceivers limit.

Short Name: Transceiver Usage

DataNode Transceivers Usage Thresholds

Description

> The health test thresholds of transceivers usage in a DataNode. Specified as a percentage of the total configured number of transceivers.

Template Name

> `datanode_transceivers_usage_thresholds`

Default Value

> critical:95.0, warning:75.0

Unit(s)

> PERCENT

Maximum Number of Transfer Threads

Description

> Specifies the maximum number of threads to use for transferring data in and out of the DataNode.

Template Name

> `dfs_datanode_max_xcievers`

Default Value

> 4096

Unit(s)

> no unit

DataNode Unexpected Exits

This DataNode health test checks that the DataNode has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period DataNode monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

unexpected_exits_window

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

unexpected_exits_thresholds

Default Value

critical:any, warning:never

Unit(s)

no unit

DataNode Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate a problem with the web server of the DataNode, a misconfiguration of the DataNode, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the DataNode for more detail. If the test failure message indicates a communication problem, the Cloudera Manager Agent's HTTP requests to the DataNode's web server are failing or timing out. If the test's failure message indicates an unexpected response, the DataNode's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection DataNode monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Description

Enables the health test that the Cloudera Manager Agent can successfully contact and gather metrics from the web server.

Template Name

datanode_web_metric_collection_enabled

Default Value

true

Unit(s)

no unit

Web Metric Collection Duration

Description

The health test thresholds on the duration of the metrics request to the web server.

Template Name

Ecs Agent Swap Memory Usage

This Ecs Agent health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

process_swap_memory_thresholds

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

Ecs Agent Swap Memory Usage Rate Beta

This Ecs Agent health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

`process_swap_memory_rate_thresholds`

Default Value

critical:never, warning:never

Unit(s)

BYTES

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

`process_swap_memory_rate_window`

Default Value

5

Unit(s)

MINUTES

Ecs Agent Unexpected Exits

This Ecs Agent health test checks that the Ecs Agent has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Ecs Agent monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

`unexpected_exits_window`

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

Event Server Cloudera Manager Descriptor Age

This is a Event Server health test that checks if the Cloudera Manager descriptor has been refreshed recently. The Cloudera Manager descriptor is used to pass configuration information from the Cloudera Manager Server to the Event Server. If the descriptor becomes stale, Event Server operation may be impacted because the Event Server will receive information about new hosts, roles, and services, or changes to existing hosts, roles, and services. A stale descriptor usually indicates problems communicating with the Cloudera Manager Server but can also indicate performance problems or a bug. Consult the Event Server log and the Cloudera Manager Server log for more information. This test can be configured using the Cloudera Manager Descriptor Age Thresholds Cloudera Manager Event Server setting.

Short Name: Cloudera Manager Descriptor Age

Cloudera Manager Descriptor Age Thresholds

Description

> The health test thresholds for monitoring the time since the Cloudera Manager descriptor was last refreshed.

Template Name

> scm_descriptor_age_thresholds

Default Value

> critical:120000.0, warning:60000.0

Unit(s)

> no unit

Event Server Event Server Index Directory Free Space

This is a Event Server health test that checks that the filesystem containing the Event Server Index Directory of this Event Server has sufficient free space. See the Event Server Index Directory description on the Event Server configuration page for more information on this directory type. This test can be configured using the Event Server Index Directory Free Space Monitoring Absolute Thresholds and Event Server Index Directory Free Space Monitoring Percentage Thresholds Event Server monitoring settings.

Short Name: Event Server Index Directory Free Space

Event Server Index Directory Free Space Monitoring Absolute Thresholds

Description

> The health test thresholds for monitoring of free space on the filesystem that contains this role's Event Server Index Directory.

Template Name

Failover Controller Process Status

This Failover Controller health test checks that the Cloudera Manager Agent on the Failover Controller host is heart beating correctly and that the process associated with the Failover Controller role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Failover Controller process, a lack of connectivity to the Cloudera Manager Agent on the Failover Controller host, or a problem with the Cloudera Manager Agent. This test can fail either because the Failover Controller has crashed or because the Failover Controller will not start or stop in a timely fashion. Check the Failover Controller logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Failover Controller host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Failover Controller host, or look in the Cloudera Manager Agent logs on the Failover Controller host for more details. This test can be enabled or disabled using the Failover Controller Process Health Test Failover Controller monitoring setting.

Short Name: Process Status

Failover Controller Process Health Test

Description

Enables the health test that the Failover Controller's process state is consistent with the role configuration

Template Name

`failovercontroller_scm_health_enabled`

Default Value

true

Unit(s)

no unit

Failover Controller Swap Memory Usage

This Failover Controller health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

`process_swap_memory_thresholds`

Default Value

critical:never, warning:200.0

Unit(s)

Flume Health Tests

Flume Agent Health

This is a Flume service-level health test that checks that enough of the Agents in the cluster are healthy. The test returns "Concerning" health if the number of healthy Agents falls below a warning threshold, expressed as a percentage of the total number of Agents. The test returns "Bad" health if the number of healthy and "Concerning" Agents falls below a critical threshold, expressed as a percentage of the total number of Agents. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Agents, this test would return "Good" health if 95 or more Agents have good health. This test would return "Concerning" health if at least 90 Agents have either "Good" or "Concerning" health. If more than 10 Agents have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Agents. Check the status of the individual Agents for more information. This test can be configured using the Flume Flume service-wide monitoring setting.

Short Name: Agent Health

Healthy Agent Monitoring Thresholds

Description

The health test thresholds of the overall Agent health. The check returns "Concerning" health if the percentage of "Healthy" Agents falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Agents falls below the critical threshold.

Template Name

    flume_agents_healthy_thresholds

HBase Health Tests

HBase Master Health

This is an HBase service-level health test that checks for an active, healthy HBase Master. The test returns "Bad" health if the service is running and an active Master cannot be found. If an active Master is found, then the test checks the health of that Master as well as the health of any standby Masters configured. A "Good" health result will only be returned if the active Master is healthy and all running standby Masters are healthy. A failure of this health test may indicate stopped or unhealthy Master roles, or it may indicate a problem with communication between the Cloudera Manager Service Monitor and the HBase service. Check the status of the HBase service's Master roles and look in the Cloudera Manager Service Monitor's log files for more information when this test fails. This test can be enabled or disabled using the Active Master Health Test HBase service-wide monitoring setting. The check for a healthy standby Master can be enabled or disabled with Backup Masters Health Test. In addition, the HBase Active Master Detection Window can be used to adjust the amount of time that the Cloudera Manager Service Monitor has to detect the active HBase Master before this health test fails.

Short Name: HBase Master Health

Active Master Health Test

Description

> When computing the overall HBase cluster health, consider the active HBase Master's health.

Template Name

> `hbase_master_health_enabled`

Default Value

> true

Unit(s)

> no unit

Backup Masters Health Test

Description

> When computing the overall HBase cluster health, consider the health of the backup HBase Masters.

Template Name

> `hbase_backup_masters_health_enabled`

Default Value

> true

Unit(s)

no unit

HBase Active Master Detection Window

Description

The tolerance window that will be used in HBase service tests that depend on detection of the active HBase Master.

Template Name

hbase_active_master_detection_window

Default Value

3

Unit(s)

MINUTES

HBase RegionServer Health

This is a HBase service-level health test that checks that enough of the RegionServers in the cluster are healthy. The test returns "Concerning" health if the number of healthy RegionServers falls below a warning threshold, expressed as a percentage of the total number of RegionServers. The test returns "Bad" health if the number of healthy and "Concerning" RegionServers falls below a critical threshold, expressed as a percentage of the total number of RegionServers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 RegionServers, this test would return "Good" health if 95 or more RegionServers have good health. This test would return "Concerning" health if at least 90 RegionServers have either "Good" or "Concerning" health. If more than 10 RegionServers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy RegionServers. Check the status of the individual RegionServers for more information. This test can be configured using the HBase HBase service-wide monitoring setting.

Short Name: RegionServer Health

Healthy RegionServer Monitoring Thresholds

Description

The health test thresholds of the overall RegionServer health. The check returns "Concerning" health if the percentage of "Healthy" RegionServers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" RegionServers falls below the critical threshold.

Template Name

hbase_regionservers_healthy_thresholds

Default Value

critical:90.0, warning:95.0

HDFS Health Tests

HDFS Canary

This is an HDFS service-level health test that checks that basic client operations are working and are completing in a reasonable amount of time. This test reports the results of a periodic "canary" test that performs the following sequence of operations. First, it creates a file. By default, the path is /tmp/.cloudera_health_monitoring_canary_timestamp. The canary test then writes a small amount of data to that file, reads that data back, and verifies that the data is correct. Lastly, the canary test removes the created file. The test returns "Bad" health if any of the basic operations fail. The test returns "Concerning" health if the canary test runs too slowly. A failure of this health test may indicate that the cluster is failing to satisfy basic client requests correctly or in a timely fashion. Check the status of the NameNode and other service-level health tests. Look in the Service Monitor logs for log messages from the canary test. Look in the NameNode logs for more details about the processing of the canary test requests. This test can be enabled or disabled using the HDFS Canary Health Check HDFS service-wide monitoring setting.

Short Name: HDFS Canary

HDFS Canary Health Check
Description

>   Enables the health check that a client can create, read, write, and delete files

Template Name

>   hdfs_canary_health_enabled

Default Value

>   true

Unit(s)

>   no unit

HDFS Corrupt Blocks

This is an HDFS service-level health test that checks that the number of corrupt blocks does not rise above some percentage of the cluster's total blocks. A block is called corrupt by HDFS if it has at least one corrupt replica along with at least one live replica. As such, a corrupt block does not indicate unavailable data, but they do indicate an increased chance that data may become unavailable. If none of a block's replicas are live, the block is called a missing block by HDFS, not a corrupt block. HDFS automatically fixes corrupt blocks in the background. A failure of this health test may indicate a problem with the underlying storage or filesystem of a DataNode. Use the HDFS fsck command to identify which files contain corrupt blocks. This test can be configured using the Blocks With Corrupt Replicas Monitoring Thresholds HDFS service-wide monitoring setting.

Short Name: Corrupt Blocks

Blocks With Corrupt Replicas Monitoring Thresholds
Description

>   The health check thresholds of the number of blocks that have at least one corrupt replica. Specified as a percentage of the total number of blocks.

Template Name

> `hdfs_blocks_with_corrupt_replicas_thresholds`

Default Value

> critical:1.0, warning:0.5

Unit(s)

> PERCENT

HDFS DataNode Health

This is a HDFS service-level health test that checks that enough of the DataNodes in the cluster are healthy. The test returns "Concerning" health if the number of healthy DataNodes falls below a warning threshold, expressed as a percentage of the total number of DataNodes. The test returns "Bad" health if the number of healthy and "Concerning" DataNodes falls below a critical threshold, expressed as a percentage of the total number of DataNodes. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 DataNodes, this test would return "Good" health if 95 or more DataNodes have good health. This test would return "Concerning" health if at least 90 DataNodes have either "Good" or "Concerning" health. If more than 10 DataNodes have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy DataNodes. Check the status of the individual DataNodes for more information. This test can be configured using the HDFS HDFS service-wide monitoring setting.

Short Name: DataNode Health

Healthy DataNode Monitoring Thresholds

Description

> The health test thresholds of the overall DataNode health. The check returns "Concerning" health if the percentage of "Healthy" DataNodes falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" DataNodes falls below the critical threshold.

Template Name

> `hdfs_datanodes_healthy_thresholds`

Default Value

> critical:90.0, warning:95.0

Unit(s)

> PERCENT

HDFS Erasure Coding Policy Verification Test

There is a high risk of losing data if the offending erasure coding policy is used. For more information, see Best Practices for Rack and Node Setup for EC. Do one of the following to clear this health issue:

- Add more DataNodes or Racks to your Cluster, if you want to use all the enabled erasure coding policies.
- Disable the offending erasure coding policy:
  - Change the default erasure coding policy, if the offending policy is set as the default policy: Go to the HDFS configuration page, search for 'Fallback Erasure Coding Policy', and select one that is compliant with your existing cluster setup.
  - Disable the offending erasure coding policy: Use the 'hdfs ec -disablePolicy -policy *policyName*' command.
- Disable the health test: Go to the HDFS configuration page, search for 'Erasure Coding Policy Verification Health Check', and unselect it. This is not recommended, because there is a high risk of losing data if the offending erasure coding policy is used.

Short Name: Erasure Coding Policy Verification Test

Erasure Coding Policy Verification Health Check

Description

Enables the health test for verifying if the cluster topology supports all the enabled erasure coding policies.

Template Name

`hdfs_verify_ec_with_topology_enabled`

Default Value

false

Unit(s)

no unit

Fallback Erasure Coding Policy

Description

The fallback Erasure Coding policy that HDFS uses if no policy is specified when you run the -setPolicy command.

Template Name

`erasure_coding_default_policy`

Default Value

CDH=[[CDH 6.0.0..CDH 8.0.0)=RS_6_3_1024K]

Unit(s)

no unit

HDFS Failover Controllers Health

This is a HDFS service-level health test that checks that all the Failover Controllers associated with this service are healthy and running. The test returns "Bad" health if any of Failover Controllers that the service depends on is unhealthy or not running. Check the Failover Controllers logs for more details This test can be enabled or disabled using the Failover Controllers Healthy service-wide monitoring setting.

Short Name: Failover Controllers Health

Failover Controllers Healthy

Description

Enables the health check that verifies that the failover controllers associated with this service are healthy and running.

Template Name

`failover_controllers_healthy_enabled`

Default Value

true

Unit(s)

no unit

HDFS Free Space

This is an HDFS service-level health test that checks that the amount of free space in the HDFS cluster does not fall below some percentage of total configured capacity. A failure of this health test may indicate a capacity planning problem, or a loss of DataNodes. An unfinalized HDFS metadata upgrade can also significantly decrease free space. This test can be configured using the HDFS Free Space Monitoring Thresholds HDFS service-wide monitoring setting.

Short Name: Free Space

HDFS Free Space Monitoring Thresholds

Description

The health check thresholds of free space in HDFS. Specified as a percentage of total HDFS capacity.

Template Name

`hdfs_free_space_thresholds`

Default Value

critical:10.0, warning:20.0

Unit(s)

PERCENT

HDFS Missing Blocks

This is an HDFS service-level health test that checks the number of missing blocks does not rise above some percentage of the cluster's total blocks. A missing block is a block with no live replicas. All replicas are either missing or corrupt. This may happen because of corruption or because DataNodes are offline or being decommissioned. A failure of this health test may indicate the loss of several DataNodes at once. If there are files stored in the cluster with a replication factor value of 1, you may see missing blocks with the loss or malfunction of a single DataNode. Use the HDFS fsck command to identify which files contain missing blocks. This test can be configured using the Missing Block Monitoring Thresholds HDFS service-wide monitoring setting.

Short Name: Missing Blocks

Missing Block Monitoring Thresholds

Description

The health check thresholds of the number of missing blocks. Specified as a percentage of the total number of blocks.

Template Name

`hdfs_missing_blocks_thresholds`

Default Value

critical:any, warning:never

Unit(s)

PERCENT

HDFS NameNode Health

This is an HDFS service-level health test that checks for and active, healthy NameNode. The test returns "Bad" health if the service is running and an active NameNode cannot be found. If an active NameNode is found, then the test checks the health of that NameNode as well as the health of any standby NameNode configured. A "Good" health result will only be returned if both the active and Standby NameNodes are healthy. A failure of this health test may indicate stopped or unhealthy NameNode roles, or it may indicate a problem with communication between the Cloudera Manager Service Monitor and the NameNodes. Check the status of the HDFS service's NameNode roles and look in the Cloudera Manager Service Monitor's log files for more information when this test fails. This test can be enabled or disabled using the Active NameNode Role Health Check HDFS service-wide monitoring setting. The check for a healthy standby NameNode can be enabled or disabled with Standby NameNode Health Check. In addition, the Active NameNode Detection Window can be used to adjust the amount of time that the Cloudera Manager Service Monitor has to detect the active NameNode before this health test fails, and the NameNode Activation Startup Tolerance can be used to adjust the amount of time around NameNode startup that the test allows for a NameNode to be made active.

Short Name: NameNode Health

Active NameNode Detection Window

Description

The tolerance window that will be used in HDFS service tests that depend on detection of the active NameNode.

Template Name

`hdfs_active_namenode_detection_window`

Default Value

3

Unit(s)

MINUTES

Active NameNode Role Health Check

Description

NameNode Activation Startup Tolerance

Description

The amount of time after NameNode(s) start that the lack of an active NameNode will be tolerated. This is intended to allow either the auto-failover daemon to make a NameNode active, or a specifically issued failover command to take effect. This is an advanced option that does not often need to be changed.

Template Name

`hdfs_namenode_activation_startup_tolerance`

Default Value

180

Unit(s)

SECONDS

Standby NameNode Health Check

Description

When computing the overall HDFS cluster health, consider the health of the standby NameNode.

Template Name

`hdfs_standby_namenodes_health_enabled`

Default Value

true

Unit(s)

no unit

HDFS Under-Replicated Blocks

This is an HDFS service-level health test that checks that the number of under-replicated blocks does not rise above some percentage of the cluster's total blocks. A failure of this health test may indicate a loss of DataNodes. Use the HDFS fsck command to identify which files contain under-replicated blocks. This test can be configured using the Under-replicated Block Monitoring Thresholds HDFS service-wide monitoring setting.

Short Name: Under-Replicated Blocks

Under-replicated Block Monitoring Thresholds

Description

The health check thresholds of the number of under-replicated blocks. Specified as a percentage of the total number of blocks.

Template Name

```
hdfs_under_replicated_blocks_thresholds
```

Default Value

critical:40.0, warning:10.0

Unit(s)

PERCENT

History Server Health Tests

History Server Audit Pipeline Test

This History Server health test checks that the Auditing for the History Server role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of History Server process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the History Server host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check History Server monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

```
mgmt_navigator_failure_window
```

Default Value

20

Unit(s)

MINUTES

Navigator Audit Failure Thresholds

Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

```
mgmt_navigator_failure_thresholds
```

Default Value

critical:any, warning:never

Unit(s)

BYTES

Navigator Audit Pipeline Health Check

Description

Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

`mgmt_navigator_status_check_enabled`

Default Value

true

Unit(s)

no unit

History Server File Descriptors

This History Server health test checks that the number of file descriptors used does not rise above some percentage of the History Server file descriptor limit. A failure of this health test may indicate a bug in either Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor Monitoring Thresholds History Server monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds

Description

The health test thresholds of the number of file descriptors used. Specified as a percentage of file descriptor limit.

Template Name

`spark3_yarn_history_server_fd_thresholds`

Default Value

critical:70.0, warning:50.0

Unit(s)

PERCENT

History Server Host Health

This History Server health test factors in the health of the host upon which the History Server is running. A failure of this test means that the host running the History Server is experiencing some problem. See that host's status page for more details.This test can be enabled or disabled using the History Server Host Health Test History Server monitoring setting.

Short Name: Host Health

History Server Host Health Test

Description

When computing the overall History Server health, consider the host's health.

Template Name

`spark3_yarn_history_server_host_health_enabled`

Default Value

true

Unit(s)

History Server Log Directory Free Space

This History Server health test checks that the filesystem containing the log directory of this History Server has sufficient free space. This test can be configured using the Log Directory Free Space Monitoring Absolute Thresholds and Log Directory Free Space Monitoring Percentage Thresholds History Server monitoring settings.

Short Name: Log Directory Free Space

Log Directory Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory.

Template Name

`log_directory_free_space_absolute_thresholds`

Default Value

critical:5.36870912E9, warning:1.073741824E10

Unit(s)

BYTES

Log Directory Free Space Monitoring Percentage Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a Log Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

`log_directory_free_space_percentage_thresholds`

Default Value

critical:never, warning:never

Unit(s)

PERCENT

History Server Process Status

This History Server health test checks that the Cloudera Manager Agent on the History Server host is heart beating correctly and that the process associated with the History Server role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the History Server process, a lack of connectivity to the Cloudera Manager Agent on the History Server host, or a problem with the Cloudera Manager Agent. This test can fail either because the History Server has crashed or because the History Server will not start or stop in a timely fashion. Check the History Server logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the History Server host, check the status of the Cloudera Manager Agent by running / etc/init.d/cloudera-scm-agent status on the History Server host, or look in the Cloudera Manager Agent logs on the History Server host for more details. This test can be enabled or disabled using the History Server Process Health Test History Server monitoring setting.

Short Name: Process Status

History Server Process Health Test

Description

Enables the health test that the History Server's process state is consistent with the role configuration

Template Name

```
spark3_yarn_history_server_scm_health_enabled
```

Default Value

true

Unit(s)

no unit

History Server Swap Memory Usage

This History Server health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

```
process_swap_memory_thresholds
```

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

History Server Swap Memory Usage Rate Beta

This History Server health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

```
process_swap_memory_rate_thresholds
```

Default Value

critical:never, warning:never

Unit(s)

Unexpected Exits Thresholds

Description

> The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

> `unexpected_exits_thresholds`

Default Value

> critical:any, warning:never

Unit(s)

> no unit

Hive Health Tests

Hive Compaction System Health Check

This is compaction system health test that checks whether compaction processes are properly configured and operational. Failure of this health test could indicate a problem with the compaction that could severely degrade query performance. Use the guidelines below for troubleshooting.

- Oldest initiated compaction passed threshold: Check the last successful compactions in the SYS.COMPACTION view. If no compactions have finished recently, check the logs for errors in the Worker threads for either the Compactor Virtual Warehouse or in the DataHub clusters, if applicable. If compactions are running successfully, but there are many queued compactions, increase the number of Worker threads set for 'hive.compactor.worker.threads' in the Compactor Virtual Warehouse or DataHub clusters. Alternatively, you can increase the amount of available resources

- Large number of compaction failures: Many compactions are failing.

  1. Run SELECT * FROM SYS.COMPACTIONS WHERE C_STATE IN ("failed", "did not initiate"); to check the error message in the sys.compaction table.
  2. Check the logs in the Compactor Virtual Warehouse for the "Caught exception while trying to compact" message.

- Oldest uncleaned compaction passed threshold: Compactor cleaner process cannot clean obsolete data.

  1. Check the metastore log to make sure the cleaner thread is running.
  2. Run SHOW TRANSACTIONS; to check if there are open transactions blocking the cleaner. If the blocking transactions are not of the 'type=REPL_CREATED', they can be aborted by running ABORT TRANSACTIONS *transactionID*;

- Old aborted transaction not cleared: An old aborted transaction was not cleared. This can impact your overall query performance. This is most likely caused by an uncompacted table. Check for failed compactions in the SYS.COMPACTION view.

- Tables/partitions with many aborts: At least one table or partition has not been compacted and have more than hive.metastore.acidmetrics.table.aborted.txns.threshold (default: 1500) aborts.

  1. Verify that the "hive.compactor.abortedtxn.threshold" is not set to a value higher than 1000.
  2. Find the affected table/partition by running SELECT TC_DATABASE, TC_TABLE, TC_PARTITION, COUNT() FROM SYS.TRANSACTIONS WHERE STATE='aborted' GROUP BY TC_DATABASE, TC_TABLE, TC_PARTITION HAVING COUNT()*n; Where n is the value of hive.metastore.acidmetrics.table.aborted.txns.threshold. The default is 1500.
  3. Check the SYS.COMPACTIONS table for compactions on this table or partition in the "did not initiate", "failed", or "ready for cleaning" state.
  4. Check the Compactor Virtual Warehouse logs for "compactor.Initiator errors associated with this table or partition.
  5. Manually initiate compaction on the table/partition by running ALTER TABLE *table-name* [PARTITION (*partition-column*=*partition-value*] COMPACT 'minor';

- Oldest open transaction passed threshold: A transaction has been open for longer than the set threshold. Stuck transactions can block cleaning obsolete files and ACID metadata, which can lead to performance degradation. Check for old open transactions with SHOW TRANSACTIONS. If these are not type=REPL_CREATED, they can be aborted with ABORT TRANSACTIONS *txnid*;

- Oldest open replication transaction passed threshold: A replication transaction has been open longer than the set threshold. Stuck transactions can block cleaning of ACID metadata, which can lead to performance degradation. Before you abort a transaction that was created by replication, and which has been open a long time, make sure that the hive.repl.txn.timeout threshold has expired. If it has, there may be an issue with replication. Please contact Cloudera Support.

- Excessive ACID metadata: An excessive amount of Hive ACID metadata exists, which can cause serious performance degradation. Failing compactions or metadata cleanup service problems can cause this.

  1. Check for failed compactions by running SELECT * FROM SYS.COMPACTIONS WHERE c_state IN ("failed", "did not initiate"); against the SYS.COMPACTIONS view.
  2. Search for failed compactions in the HiveServer2 logs, which are indicated with the message "Caught exception while trying to compact"

- Excessive ACID metadata: An excessive amount of Hive ACID metadata exists, which can cause serious performance degradation. Failing compactions or metadata cleanup service problems can cause this.

    1. Check for failed compactions by running SELECT * FROM SYS.COMPACTIONS WHERE c_state IN ("failed", "did not initiate"); against the SYS.COMPACTIONS view.
    2. Search for failed compactions in the HiveServer2 logs, which are indicated with the message "Caught exception while trying to compact"
- Activity on table with disabled auto-compaction: A change has been made on a table where automated compaction is disabled. If this is not intended, re-enable compaction on the table by running ALTER TABLE table_name SET TBLPROPERTIES ("no_auto_compaction" = "false").
- Table/partition with large number of active delta directories There are tables with a large number of delta directories, which can cause performance degradation. Check the "Top 100 partitions or unpartitioned tables with the most active deltas" chart in CM to see affected tables and partitions. These tables and partitions should be compacted.
- Table/partition with large number of small delta directories There are tables with a large number of small delta directories, which can cause performance degradation. Check the "Top 100 partitions or unpartitioned tables with the most small deltas" chart in CM to see affected tables and partitions. These tables and partitions should be compacted.

This test can be configured using the Hive Compaction Health Test Hive monitoring settings.

Short Name: Compaction System Health Check

Excessive ACID metadata (CompletedTxnComponents) Thresholds

Hive Metastore Server Health

This is a Hive service-level health test that checks that enough of the Hive Metastore Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Hive Metastore Servers falls below a warning threshold, expressed as a percentage of the total number of Hive Metastore Servers. The test returns "Bad" health if the number of healthy and "Concerning" Hive Metastore Servers falls below a critical threshold, expressed as a percentage of the total number of Hive Metastore Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Hive Metastore Servers, this test would return "Good" health if 95 or more Hive Metastore Servers have good health. This test would return "Concerning" health if at least 90 Hive Metastore Servers have either "Good" or "Concerning" health. If more than 10 Hive Metastore Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Hive Metastore Servers. Check the status of the individual Hive Metastore Servers for more information. This test can be configured using the Hive Hive service-wide monitoring setting.

Short Name: Hive Metastore Server Health

Healthy Hive Metastore Server Monitoring Thresholds

Description

The health test thresholds of the overall Hive Metastore Server health. The check returns "Concerning" health if the percentage of "Healthy" Hive Metastore Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Hive Metastore Servers falls below the critical threshold.

Hive Metastore Server Hive Metastore Canary

This is a Hive Metastore health test that checks that a client can connect and perform basic operations. The operations include: (1) creating a database, (2) creating a table within that database with several types of columns and two partition keys, (3) creating a number of partitions, and (4) dropping both the table and the database. The database is created under the /user/hue/.cloudera_manager_hive_metastore_canary/*Hive Metastore role name*/ and is named "cloudera_manager_metastore_canary_test_db". The test returns "Bad" health if any of these operations fail. The test returns "Concerning" health if an unknown failure happens. The canary publishes a metric 'canary_duration' for the time it took for the canary to complete. Here is an example of a trigger, defined for the Hive Metastore role configuration group, that changes the health to "Bad" when the duration of the canary is longer than 5 sec: "IF (SELECT canary_duration WHERE entityName=$ROLENAME AND category = ROLE and last(canary_duration) > 5s) DO health:bad" A failure of this health test may indicate that the Hive Metastore is failing basic operations. Check the logs of the Hive Metastore and the Cloudera Manager Service Monitor for more details. This test can be enabled or disabled using the Hive Metastore Canary Health Test Hive Metastore monitoring setting.

Short Name: Hive Metastore Canary

Hive Metastore Canary Health Test

Description

Enables the health test that checks that basic Hive Metastore operations succeed

Template Name

`metastore_canary_health_enabled`

Default Value

true

Unit(s)

Hive Metastore Server Pause Duration

This Hive Metastore Server health test checks that the Hive Metastore Server threads are not experiencing long scheduling pauses. The test uses a pause monitoring thread in the Hive Metastore Server that tracks scheduling delay by noting if it is run on its requested schedule. If the thread is not run on its requested schedule, the delay is noted and considered pause time. The health test checks that no more than some percentage of recent time is spent paused. A failure of this health test may indicate that the Hive Metastore Server is not getting enough CPU resources, or that it is spending too much time doing garbage collection. Inspect the Hive Metastore Server logs for any pause monitor output and check garbage collection metrics exposed by the Hive Metastore Server. This test can be configured using the Pause Duration Thresholds and Pause Duration Monitoring Period Hive Metastore Server monitoring settings.

Short Name: Pause Duration

Pause Duration Monitoring Period

Description

The period to review when computing the moving average of extra time the pause monitor spent paused.

Template Name

```
hivemetastore_pause_duration_window
```

Default Value

5

Unit(s)

Hive Metastore Server Process Status

This Hive Metastore Server health test checks that the Cloudera Manager Agent on the Hive Metastore Server host is heart beating correctly and that the process associated with the Hive Metastore Server role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Hive Metastore Server process, a lack of connectivity to the Cloudera Manager Agent on the Hive Metastore Server host, or a problem with the Cloudera Manager Agent. This test can fail either because the Hive Metastore Server has crashed or because the Hive Metastore Server will not start or stop in a timely fashion. Check the Hive Metastore Server logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Hive Metastore Server host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Hive Metastore Server host, or look in the Cloudera Manager Agent logs on the Hive Metastore Server host for more details. This test can be enabled or disabled using the Hive Metastore Server Process Health Test Hive Metastore Server monitoring setting.

Short Name: Process Status

Hive Metastore Server Process Health Test

Description

Enables the health test that the Hive Metastore Server's process state is consistent with the role configuration

Template Name

```
hivemetastore_scm_health_enabled
```

Default Value

Default Value

critical:any, warning:never

Unit(s)

no unit

Hive on Tez Health Tests

Hive on Tez Compaction System Health Check

This is compaction system health test that checks whether compaction processes are properly configured and operational. Failure of this health test could indicate a problem with the compaction that could severely degrade query performance. Use the guidelines below for troubleshooting.

- Oldest initiated compaction passed threshold: Check the last successful compactions in the SYS.COMPACTION view. If no compactions have finished recently, check the logs for errors in the Worker threads for either the Compactor Virtual Warehouse or in the DataHub clusters, if applicable. If compactions are running successfully, but there are many queued compactions, increase the number of Worker threads set for 'hive.compactor.worker.threads' in the Compactor Virtual Warehouse or DataHub clusters. Alternatively, you can increase the amount of available resources
- Large number of compaction failures: Many compactions are failing.

  1. Run SELECT * FROM SYS.COMPACTIONS WHERE C_STATE IN ("failed", "did not initiate"); to check the error message in the sys.compaction table.
  2. Check the logs in the Compactor Virtual Warehouse for the "Caught exception while trying to compact" message.
- Oldest uncleaned compaction passed threshold: Compactor cleaner process cannot clean obsolete data.

  1. Check the metastore log to make sure the cleaner thread is running.
  2. Run SHOW TRANSACTIONS; to check if there are open transactions blocking the cleaner. If the blocking transactions are not of the 'type=REPL_CREATED', they can be aborted by running ABORT TRANSACTIONS *transactionID*;
- Old aborted transaction not cleared: An old aborted transaction was not cleared. This can impact your overall query performance. This is most likely caused by an uncompacted table. Check for failed compactions in the SYS.COMPACTION view.
- Tables/partitions with many aborts: At least one table or partition has not been compacted and have more than hive.metastore.acidmetrics.table.aborted.txns.threshold (default: 1500) aborts.

  1. Verify that the "hive.compactor.abortedtxn.threshold" is not set to a value higher than 1000.
  2. Find the affected table/partition by running SELECT TC_DATABASE, TC_TABLE, TC_PARTITION, COUNT() FROM SYS.TRANSACTIONS WHERE STATE='aborted' GROUP BY TC_DATABASE, TC_TABLE, TC_PARTITION HAVING COUNT()*n; Where n is the value of hive.metastore.acidmetrics.table.aborted.txns.threshold. The default is 1500.
  3. Check the SYS.COMPACTIONS table for compactions on this table or partition in the "did not initiate", "failed", or "ready for cleaning" state.
  4. Check the Compactor Virtual Warehouse logs for "compactor.Initiator errors associated with this table or partition.
  5. Manually initiate compaction on the table/partition by running ALTER TABLE *table-name* [PARTITION (*partition-column*=*partition-value*] COMPACT 'minor';
- Oldest open transaction passed threshold: A transaction has been open for longer than the set threshold. Stuck transactions can block cleaning obsolete files and ACID metadata, which can lead to performance degradation. Check for old open transactions with SHOW TRANSACTIONS. If these are not type=REPL_CREATED, they can be aborted with ABORT TRANSACTIONS *txnid*;

- Oldest open replication transaction passed threshold: A replication transaction has been open longer than the set threshold. Stuck transactions can block cleaning of ACID metadata, which can lead to performance degradation. Before you abort a transaction that was created by replication, and which has been open a long time, make sure that the hive.repl.txn.timeout threshold has expired. If it has, there may be an issue with replication. Please contact Cloudera Support.
- Excessive ACID metadata: An excessive amount of Hive ACID metadata exists, which can cause serious performance degradation. Failing compactions or metadata cleanup service problems can cause this.

  1. Check for failed compactions by running SELECT * FROM SYS.COMPACTIONS WHERE c_state IN ("failed", "did not initiate"); against the SYS.COMPACTIONS view.
  2. Search for failed compactions in the HiveServer2 logs, which are indicated with the message "Caught exception while trying to compact"

- Excessive ACID metadata: An excessive amount of Hive ACID metadata exists, which can cause serious performance degradation. Failing compactions or metadata cleanup service problems can cause this.

  1. Check for failed compactions by running SELECT * FROM SYS.COMPACTIONS WHERE c_state IN ("failed", "did not initiate"); against the SYS.COMPACTIONS view.
  2. Search for failed compactions in the HiveServer2 logs, which are indicated with the message "Caught exception while trying to compact"

- Activity on table with disabled auto-compaction: A change has been made on a table where automated compaction is disabled. If this is not intended, re-enable compaction on the table by running ALTER TABLE table_name SET TBLPROPERTIES ("no_auto_compaction" = "false").
- Table/partition with large number of active delta directories There are tables with a large number of delta directories, which can cause performance degradation. Check the "Top 100 partitions or unpartitioned tables with the most active deltas" chart in CM to see affected tables and partitions. These tables and partitions should be compacted.
- Table/partition with large number of small delta directories There are tables with a large number of small delta directories, which can cause performance degradation. Check the "Top 100 partitions or unpartitioned tables with the most small deltas" chart in CM to see affected tables and partitions. These tables and partitions should be compacted.

This test can be configured using the Tables/Partitions with Large Number of Active Delta Directories Thresholds Hive monitoring settings.

Short Name: Compaction System Health Check

Tables/Partitions with Large Number of Active Delta Directories Thresholds
Description

The health test thresholds for table/partition with large number of active delta directories.

Hive on Tez HiveServer2 Health

This is a Hive on Tez service-level health test that checks that enough of the HiveServer2s in the cluster are healthy. The test returns "Concerning" health if the number of healthy HiveServer2s falls below a warning threshold, expressed as a percentage of the total number of HiveServer2s. The test returns "Bad" health if the number of healthy and "Concerning" HiveServer2s falls below a critical threshold, expressed as a percentage of the total number of HiveServer2s. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 HiveServer2s, this test would return "Good" health if 95 or more HiveServer2s have good health. This test would return "Concerning" health if at least 90 HiveServer2s have either "Good" or "Concerning" health. If more than 10 HiveServer2s have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy HiveServer2s. Check the status of the individual HiveServer2s for more information. This test can be configured using the Hive on Tez Hive on Tez service-wide monitoring setting.

Short Name: HiveServer2 Health

Healthy HiveServer2 Monitoring Thresholds
Description

The health test thresholds of the overall HiveServer2 health. The check returns "Concerning" health if the percentage of "Healthy" HiveServer2s falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" HiveServer2s falls below the critical threshold.

Host Agent Status

This is a host health test that checks that the host's Cloudera Manager Agent is heartbeating correctly to the Cloudera Manager Server, is in contact with the Host Monitor, and has the correct software version. A failure of this health test may indicate a lack of connectivity between the host's Cloudera Manager Agent and the Cloudera Manager Server, a

lack of connectivity betwen the host's Cloudera Manager Agent and the Host Monitor, or that the Cloudera Manager Agent or Host Monitor software is out of date. Check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the host, or look in the host's Cloudera Manager Agent logs for more details. If this test reports a software version mismatch between the Cloudera Manager Agent and the Host Monitor, check the version of each component by consulting the appropriate logs or the appropriate status web pages. This test can be enabled or disabled using the Host Process Health Test host configuration setting.

Short Name: Agent Status

Host Process Health Test

Description

Enables the health test that the host's process state is consistent with the role configuration

Template Name

`host_scm_health_enabled`

Default Value

true

Unit(s)

no unit

Host Certificate Expiration

This health test checks the expiry time of the TLS certificate for the Cloudera Manager Agent on the given host. This test can be configured using the Cloudera Manager Agent TLS Certificate Expiry Thresholds host monitoring setting. This test alerts when the certificate is close to expiry.

Short Name: Certificate Expiration

Cloudera Manager Agent TLS Certificate Expiry Thresholds

Description

The health test thresholds for monitoring the certificate of Cloudera Manager Agent.

Template Name

`host_agent_certificate_expiry_thresholds`

Default Value

critical:7.0, warning:60.0

Unit(s)

DAYS

Host Clock Offset

This is a host health test that checks whether the host's system clock appears to be out-of-sync with its NTP server(s). The test uses either the 'ntpq -np' (if ntpd is running) or 'chronyc sources' (if chronyd is running) command to check that whether the host is synchronized to an NTP peer and that the absolute value of the host's clock offset from that peer is not too large. The test returns "Bad" health If the command fails to find a synchronized NTP peer or an offset between the peer and the host time is too large. To troubleshoot, run 'ntpq -np' or 'chronyc sources' on the host. The output should contain a row for each of the host's NTP servers. The row starting with a '*' (if ntpdc) or '^*' (if chronyc) contains the peer to which the host is currently synchronized. If no row starts with a '*' or '^*', this indicates that the host is not currently synchronized. Make sure you have a pool of valid ntp servers in your ntp.conf (if ntpdc) or chrony.conf (if chronyc). Make sure that UDP port 123 is open on any firewall that is in use. Check the system log for ntpd or chronyd messages related to configuration errors. If the issue persists or the offset between the peer and the host time is too large, please seek assistance from your system administrator. If NTP is not in use on the host, disable this check by setting both 'Warning' and 'Critical' thresholds to 'NEVER' using the configuration options

shown below for the host. Cloudera recommends using NTP for time synchronization of Hadoop clusters. This test can be configured using the Host Clock Offset Thresholds host configuration setting.

Short Name: Clock Offset

Host Clock Offset Thresholds

Description

The thresholds for the host clock offset health test. The test compares this threshold against the absolute value of the clock offset reported by the host's NTP service from the 'ntpdc -np' or 'chronyc sources' command. Setting both the warning and critical threshold values to never turns off collection of the clock offset by the Cloudera Manager Agent. If no time synchronization is in use, both threshold values should be set to never. Cloudera recommends using NTP for time synchronization of Hadoop clusters.

Template Name

`host_clock_offset_thresholds`

Default Value

critical:10000.0, warning:3000.0

Unit(s)

MILLISECONDS

Host DNS Resolution

This is a host health test that checks that the host's hostname and canonical name are consistent when checked from a Java process, and that the DNS resolution completes in a timely manner. The DNS resolution duration is calculated by measuring the time taken to call getLocalHost in a Java process on this host. Note that DNS information may be cached on the host, and this caching can affect the reported resolution duration. A failure of this health test may indicate that the host's DNS configuration is not correct or the host's DNS server is responding slowly. Check the Cloudera Manager Agent log for the names that were detected by this test or for errors running the Java process. The hostname and canonical name are considered to be consistent if the hostname or the hostname plus a domain name is the same as the canonical name. This health test uses domain names from the domain and search lines in /etc/resolv.conf. This health test does not consult /etc/nsswitch.conf and may give incorrect results if /etc/resolv.conf is not used by the host. There may be a delay of up to 5 minutes before this health test picks up changes to /etc/resolv.conf. This test can be configured using the Hostname and Canonical Name Health Check host configuration setting.

Short Name: DNS Resolution

Hostname and Canonical Name Health Check

Description

Whether the hostname and canonical names for this host are consistent when checked from a Java process.

Template Name

`host_dns_resolution_enabled`

Default Value

true

Unit(s)

no unit

Host Entropy

This is a health test that checks that the host in a cluster has sufficient entropy. A failure of this health may indicate that entropy pool is depleted, which might cause applications waiting for the randomness to pause until more entropy

is available. Random connection timeout issues usually happen when the available entropy count reaches zero. Increase the entropy using rng-tools for the host. This test can be configured using the Host Entropy Thresholds host configuration settings.

Short Name: Entropy

Host Entropy Thresholds

Description

> The health check thresholds for the available entropy on the host.

Template Name

> `host_available_entropy_thresholds`

Default Value

> critical:50.0, warning:100.0

Unit(s)

> no unit

Host Frame Errors

This is a host health test that checks for network frame errors across all network interfaces. A failure of this health test may indicate a problem with network hardware (e.g. switches) and can potentially cause other service or role-level performance problems. Check the host and network hardware logs for more details. This test can be configured using the Host Network Frame Error Percentage Thresholds, Host Network Frame Error Check Window, Host Network Frame Error Test Minimum Required Packets host configuration settings.

Short Name: Frame Errors

Host Network Frame Error Check Window

Description

> The amount of time over which the host frame error checks for frame errors.

Template Name

> `host_network_frame_errors_window`

Default Value

> 15

Unit(s)

> MINUTES

Host Network Frame Error Percentage Thresholds

Description

> The health check thresholds for the percentage of received packets that are frame errors.

Template Name

> `host_network_frame_errors_thresholds`

Default Value

> critical:0.5, warning:any

Unit(s)

> PERCENT

Host Network Frame Error Test Minimum Required Packets

Description

The minimum number of received packets that must be received within the test window for this test to return "Bad" health. If less that this number of packets is received during the test window, the health check will never return "Bad" health.

Template Name

> `host_network_frame_errors_floor`

Default Value

> 0

Unit(s)

> no unit

Host Network Interface Speed

This is a host health test that checks for network interfaces that appear to be operating at less than full speed. The Cloudera Manager Agent uses ethtool ioctl to determine the network interface speed and duplex mode. A failure of this health test may indicate that network interface(s) may be configured incorrectly and may be causing performance problems. Use the ethtool command to check and configure the host's network interfaces to use the fastest available link speed and duplex mode. For inactive interfaces or for interfaces that do not support ethtool ioctl, the Cloudera Manager Agent cannot collect speed metrics. If the Cloudera Manager Agent fails to collect speed metrics for all network interfaces on the host, the test is disabled. This test can be configured using the Host's Network Interfaces Slow Link Modes Thresholds, Network Interface Expected Link Speed and Network Interface Expected Duplex Mode host configuration settings.

Short Name: Network Interface Speed

Host's Network Interfaces Slow Link Modes Thresholds

Description

> The thresholds for the health check of the number of network interfaces that appear to be operating at less than full speed.

Template Name

> `host_network_interfaces_slow_mode_thresholds`

Default Value

HttpFS Process Status

This HttpFS health test checks that the Cloudera Manager Agent on the HttpFS host is heart beating correctly and that the process associated with the HttpFS role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the HttpFS process, a lack of connectivity to the Cloudera Manager Agent on the HttpFS host, or a problem with the Cloudera Manager Agent. This test can fail either because the HttpFS has crashed or because the HttpFS will not start or stop in a timely fashion. Check the HttpFS logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the HttpFS host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the HttpFS host, or look in the Cloudera Manager Agent logs on the HttpFS host for more details. This test can be enabled or disabled using the HttpFS Process Health Test HttpFS monitoring setting.

Short Name: Process Status

HttpFS Process Health Test

Description

Enables the health test that the HttpFS's process state is consistent with the role configuration

Template Name

httpfs_scm_health_enabled

Default Value

true

Unit(s)

no unit

HttpFS Swap Memory Usage

This HttpFS health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

process_swap_memory_thresholds

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

HttpFS Swap Memory Usage Rate Beta

This HttpFS health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

process_swap_memory_rate_thresholds

Default Value

critical:never, warning:never

Unit(s)

BYTES

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

`process_swap_memory_rate_window`

Default Value

5

Unit(s)

MINUTES

HttpFS Unexpected Exits

This HttpFS health test checks that the HttpFS has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period HttpFS monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

`unexpected_exits_window`

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

`unexpected_exits_thresholds`

Default Value

critical:any, warning:never

Unit(s)

no unit

Hue Health Tests

Hue Kerberos Ticket Renewer Health

This is a Hue service-level health test that checks that enough of the Kerberos Ticket Renewers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Kerberos Ticket Renewers falls below a warning threshold, expressed as a percentage of the total number of Kerberos Ticket Renewers. The test returns "Bad" health if the number of healthy and "Concerning" Kerberos Ticket Renewers falls below a critical threshold, expressed as a percentage of the total number of Kerberos Ticket Renewers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Kerberos Ticket Renewers, this test would return "Good" health if 95 or more Kerberos Ticket Renewers have good health. This test would return "Concerning" health if at least 90 Kerberos Ticket Renewers have either "Good" or "Concerning" health. If more than 10 Kerberos Ticket Renewers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Kerberos Ticket Renewers. Check the status of the individual Kerberos Ticket Renewers for more information. This test can be configured using the Hue Hue service-wide monitoring setting.

Short Name: Kerberos Ticket Renewer Health

Healthy Kerberos Ticket Renewer Monitoring Thresholds

Description

The health test thresholds of the overall Kerberos Ticket Renewer health. The check returns "Concerning" health if the percentage of "Healthy" Kerberos Ticket Renewers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Kerberos Ticket Renewers falls below the critical threshold.

Template Name

Unit(s)

> no unit

Impala Catalog Server Resident Set Size

This Impala Catalog Server health test checks that the size of the resident set does not rise above a configured threshold value. A failure of this health test may indicates that the Impala Catalog Server process is consuming more memory than expected. It is possible that that unexpected memory consumption may lead to swapping and decreased performance for processes running on the same host as this Impala Catalog Server. Increased Impala Catalog Server memory consumption may be caused by an increased workload on the Impala service, or by a bug in the Impala Catalog Server software. To avoid failures of this health test, free up additional memory for this Impala Catalog

Server process and increase the Resident Set Size Thresholds monitoring setting. This test can be configured using the Resident Set Size Thresholds Impala Catalog Server monitoring setting.

Short Name: Resident Set Size

Resident Set Size Thresholds

Description

The health test thresholds on the resident size of the process.

Template Name

process_resident_set_size_thresholds

Default Value

critical:never, warning:never

Default Value

>   critical:any, warning:never

Unit(s)

>   no unit

Impala Catalog Server Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate a problem with the web server of the Impala Catalog Server, a misconfiguration of the Impala Catalog Server, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the Impala Catalog Server for more detail. If the test failure message indicates a communication problem, the Cloudera

Manager Agent's HTTP requests to the Impala Catalog Server's web server are failing or timing out. If the test's failure message indicates an unexpected response, the Impala Catalog Server's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection Impala Catalog Server monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Description

Enables the health test that the Cloudera Manager Agent can successfully contact and gather metrics from the web server.

Template Name

```
catalogserver_web_metric_collection_enabled
```

This Impala Llama ApplicationMaster health test checks that the Cloudera Manager Agent on the Impala Llama ApplicationMaster host is heart beating correctly and that the process associated with the Impala Llama ApplicationMaster role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Impala Llama ApplicationMaster process, a lack of connectivity to the Cloudera Manager Agent on the Impala Llama ApplicationMaster host, or a problem with the Cloudera Manager Agent. This test can fail either because the Impala Llama ApplicationMaster has crashed or because the Impala Llama ApplicationMaster will not start or stop in a timely fashion. Check the Impala Llama ApplicationMaster logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Impala Llama ApplicationMaster host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Impala Llama ApplicationMaster host, or look in the Cloudera Manager Agent logs on the Impala Llama ApplicationMaster host for more details. This test can be enabled or disabled using the Impala Llama ApplicationMaster Process Health Test Impala Llama ApplicationMaster monitoring setting.

Short Name: Process Status

Impala Llama ApplicationMaster Process Health Test

Description

Enables the health test that the Impala Llama ApplicationMaster's process state is consistent with the role configuration

Template Name

Impala Llama ApplicationMaster Swap Memory Usage

This Impala Llama ApplicationMaster health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

`process_swap_memory_thresholds`

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

Impala Llama ApplicationMaster Swap Memory Usage Rate Beta

This Impala Llama ApplicationMaster health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

`process_swap_memory_rate_thresholds`

Default Value

critical:never, warning:never

Unit(s)

BYTES

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

`process_swap_memory_rate_window`

Default Value

5

Unit(s)

MINUTES

Impala Llama ApplicationMaster Unexpected Exits

This Impala Llama ApplicationMaster health test checks that the Impala Llama ApplicationMaster has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Impala Llama ApplicationMaster monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

`unexpected_exits_window`

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

`unexpected_exits_thresholds`

Default Value

JobTracker Process Status

This JobTracker health test checks that the Cloudera Manager Agent on the JobTracker host is heart beating correctly and that the process associated with the JobTracker role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the JobTracker process, a lack of connectivity to the Cloudera Manager Agent on the JobTracker host, or a problem with the Cloudera Manager Agent. This test can fail either because the JobTracker has crashed or because the JobTracker will not start or stop in a timely fashion. Check the JobTracker logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the JobTracker host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the JobTracker host, or look in the Cloudera Manager Agent logs on the JobTracker host for more details. This test can be enabled or disabled using the JobTracker Process Health Test JobTracker monitoring setting.

Short Name: Process Status

JobTracker Process Health Test

Description

Enables the health test that the JobTracker's process state is consistent with the role configuration

Template Name

jobtracker_scm_health_enabled

Default Value

true

Unit(s)

no unit

JobTracker Swap Memory Usage

This JobTracker health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

process_swap_memory_thresholds

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

JobTracker Swap Memory Usage Rate Beta

This JobTracker health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

Description

> The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

> unexpected_exits_thresholds

Default Value

> critical:any, warning:never

Unit(s)

> no unit

JobTracker Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate a problem with the web server of the JobTracker, a misconfiguration of the JobTracker, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the JobTracker for more detail. If the test failure message indicates a communication problem, the Cloudera Manager Agent's HTTP requests to the JobTracker's web server are failing or timing out. If the test's failure message indicates an unexpected response, the JobTracker's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection JobTracker monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Kafka Health Tests

Kafka Broker Health

This is a Kafka service-level health test that checks that enough of the Kafka Brokers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Kafka Brokers falls below a warning threshold, expressed as a percentage of the total number of Kafka Brokers. The test returns "Bad" health if the number of healthy and "Concerning" Kafka Brokers falls below a critical threshold, expressed as a percentage of the total number of Kafka Brokers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Kafka Brokers, this test would return "Good" health if 95 or more Kafka Brokers have good health. This test would return "Concerning" health if at least 90 Kafka Brokers have either "Good" or "Concerning" health. If more than 10 Kafka Brokers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Kafka Brokers. Check the status of the individual Kafka Brokers for more information. This test can be configured using the Kafka Kafka service-wide monitoring setting.

Short Name: Kafka Broker Health

Healthy Kafka Broker Monitoring Thresholds

Description

> The health test thresholds of the overall Kafka Broker health. The check returns "Concerning" health if the percentage of "Healthy" Kafka Brokers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Kafka Brokers falls below the critical threshold.

Key Management Server Proxy Health Tests

Key Management Server Proxy Audit Pipeline Test

This Key Management Server Proxy health test checks that the Auditing for the Key Management Server Proxy role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of Key Management Server Proxy process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the Key Management Server Proxy host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check Key Management Server Proxy monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

mgmt_navigator_failure_window

Default Value

20

Unit(s)

MINUTES

Navigator Audit Failure Thresholds

Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

mgmt_navigator_failure_thresholds

Default Value

critical:any, warning:never

Unit(s)

BYTES

Navigator Audit Pipeline Health Check

Description

Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

mgmt_navigator_status_check_enabled

Default Value

true

Unit(s)

no unit

Key Management Server Proxy File Descriptors

This Key Management Server Proxy health test checks that the number of file descriptors used does not rise above some percentage of the Key Management Server Proxy file descriptor limit. A failure of this health test may indicate a bug in either Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor Monitoring Thresholds Key Management Server Proxy monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds

Description

The health test thresholds of the number of file descriptors used. Specified as a percentage of file descriptor limit.

Template Name

kms_keytrustee_fd_thresholds

Default Value

critical:70.0, warning:50.0

Unit(s)

PERCENT

Key Management Server Proxy Host Health

This Key Management Server Proxy health test factors in the health of the host upon which the Key Management Server Proxy is running. A failure of this test means that the host running the Key Management Server Proxy is experiencing some problem. See that host's status page for more details.This test can be enabled or disabled using the Key Management Server Proxy Host Health Test Key Management Server Proxy monitoring setting.

Short Name: Host Health

Key Management Server Proxy Host Health Test

Description

When computing the overall Key Management Server Proxy health, consider the host's health.

Template Name

kms_keytrustee_host_health_enabled

Default Value

true

Unit(s)

no unit

Key Management Server Proxy Log Directory Free Space

This Key Management Server Proxy health test checks that the filesystem containing the log directory of this Key Management Server Proxy has sufficient free space. This test can be configured using the Log Directory Free Space Monitoring Absolute Thresholds and Log Directory Free Space Monitoring Percentage Thresholds Key Management Server Proxy monitoring settings.

Short Name: Log Directory Free Space

Log Directory Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory.

Template Name

> `log_directory_free_space_absolute_thresholds`

Default Value

> critical:5.36870912E9, warning:1.073741824E10

Unit(s)

Key Management Server Proxy Process Status

This Key Management Server Proxy health test checks that the Cloudera Manager Agent on the Key Management Server Proxy host is heart beating correctly and that the process associated with the Key Management Server Proxy role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Key Management Server Proxy process, a lack of connectivity to the Cloudera Manager Agent on the Key Management Server Proxy host, or a problem with the Cloudera Manager Agent. This test can fail either because the Key Management Server Proxy has crashed or because the Key Management Server Proxy will not start or stop in a timely fashion. Check the Key Management Server Proxy logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Key Management Server Proxy host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Key Management Server Proxy host, or look in the Cloudera Manager Agent logs on the Key Management Server Proxy host for more details. This test can be enabled or disabled using the Key Management Server Proxy Process Health Test Key Management Server Proxy monitoring setting.

Short Name: Process Status

Key Management Server Proxy Process Health Test

Description

> Enables the health test that the Key Management Server Proxy's process state is consistent with the role configuration

Template Name

> `kms_keytrustee_scm_health_enabled`

Default Value

Key-Value Store Indexer Health Tests

Key-Value Store Indexer Lily HBase Indexer Health

This is a Key-Value Store Indexer service-level health test that checks that enough of the Lily HBase Indexers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Lily HBase Indexers falls below a warning threshold, expressed as a percentage of the total number of Lily HBase Indexers. The test returns "Bad" health if the number of healthy and "Concerning" Lily HBase Indexers falls below a critical threshold, expressed as a percentage of the total number of Lily HBase Indexers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Lily HBase Indexers, this test would return "Good" health if 95 or more Lily HBase Indexers have good health. This test would return "Concerning" health if at least 90 Lily HBase Indexers have either "Good" or "Concerning" health. If more than 10 Lily HBase Indexers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Lily HBase Indexers. Check the status of the individual Lily HBase Indexers for more information. This test can be configured using the Key-Value Store Indexer Key-Value Store Indexer service-wide monitoring setting.

Short Name: Lily HBase Indexer Health

Healthy Lily HBase Indexer Monitoring Thresholds

Description

> The health test thresholds of the overall Lily HBase Indexer health. The check returns "Concerning" health if the percentage of "Healthy" Lily HBase Indexers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Lily HBase Indexers falls below the critical threshold.

This LLAP Proxy health test checks that the Auditing for the LLAP Proxy role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of LLAP Proxy process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the LLAP Proxy host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check LLAP Proxy monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

> The period to review when checking if audits are blocked and not getting processed.

Template Name

Default Value

> 20

Unit(s)

> MINUTES

Navigator Audit Failure Thresholds

Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

`mgmt_navigator_failure_thresholds`

Default Value

critical:any, warning:never

Unit(s)

BYTES

Navigator Audit Pipeline Health Check

Description

Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

`mgmt_navigator_status_check_enabled`

Default Value

true

Unit(s)

no unit

LLAP Proxy File Descriptors

This LLAP Proxy health test checks that the number of file descriptors used does not rise above some percentage of the LLAP Proxy file descriptor limit. A failure of this health test may indicate a bug in either Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor Monitoring Thresholds LLAP Proxy monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds

Description

The health test thresholds of the number of file descriptors used. Specified as a percentage of file descriptor limit.

Template Name

`llapproxy_fd_thresholds`

Default Value

critical:70.0, warning:50.0

Unit(s)

PERCENT

LLAP Proxy Heap Dump Directory Free Space

This LLAP Proxy health test checks that the filesystem containing the heap dump directory of this LLAP Proxy has sufficient free space. This test can be configured using the Heap Dump Directory Free Space Monitoring Absolute Thresholds and Heap Dump Directory Free Space Monitoring Percentage Thresholds LLAP Proxy monitoring settings.

Short Name: Heap Dump Directory Free Space

Heap Dump Directory Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's heap dump directory.

Template Name

`heap_dump_directory_free_space_absolute_thresholds`

Default Value

critical:5.36870912E9, warning:1.073741824E10

Unit(s)

BYTES

Heap Dump Directory Free Space Monitoring Percentage Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's heap dump directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a Heap Dump Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

`heap_dump_directory_free_space_percentage_thresholds`

Default Value

critical:never, warning:never

Unit(s)

LLAP Proxy Pause Duration

This LLAP Proxy health test checks that the LLAP Proxy threads are not experiencing long scheduling pauses. The test uses a pause monitoring thread in the LLAP Proxy that tracks scheduling delay by noting if it is run on its requested schedule. If the thread is not run on its requested schedule, the delay is noted and considered pause time. The health test checks that no more than some percentage of recent time is spent paused. A failure of this health test may indicate that the LLAP Proxy is not getting enough CPU resources, or that it is spending too much time doing garbage collection. Inspect the LLAP Proxy logs for any pause monitor output and check garbage collection metrics exposed by the LLAP Proxy. This test can be configured using the Pause Duration Thresholds and Pause Duration Monitoring Period LLAP Proxy monitoring settings.

Short Name: Pause Duration

Pause Duration Monitoring Period
Description

The period to review when computing the moving average of extra time the pause monitor spent paused.

Template Name

llapproxy_pause_duration_window

Default Value

5

Unit(s)

MINUTES

Pause Duration Thresholds
Description

The health test thresholds for the weighted average extra time the pause monitor spent paused. Specified as a percentage of elapsed wall clock time.

Template Name

llapproxy_pause_duration_thresholds

Default Value

Livy Health Tests

Livy Server Health

This is a Livy service-level health test that checks that enough of the Livy Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Livy Servers falls below a warning threshold, expressed as a percentage of the total number of Livy Servers. The test returns "Bad" health if the number of healthy and "Concerning" Livy Servers falls below a critical threshold, expressed as a percentage of the total number of Livy Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Livy Servers, this test would return "Good" health if 95 or more Livy Servers have good health. This test would return "Concerning" health if at least 90 Livy Servers have either "Good" or "Concerning" health. If more than 10 Livy Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Livy Servers. Check the status of the individual Livy Servers for more information. This test can be configured using the Livy Livy service-wide monitoring setting.

Short Name: Livy Server Health

Healthy Livy Server Monitoring Thresholds

Description

The health test thresholds of the overall Livy Server health. The check returns "Concerning" health if the percentage of "Healthy" Livy Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Livy Servers falls below the critical threshold.

Livy for Spark 3 Health Tests

Livy for Spark 3 Livy Server for Spark 3 Health

This is a Livy for Spark 3 service-level health test that checks that enough of the Livy Server for Spark 3s in the cluster are healthy. The test returns "Concerning" health if the number of healthy Livy Server for Spark 3s falls below a warning threshold, expressed as a percentage of the total number of Livy Server for Spark 3s. The test returns "Bad"

health if the number of healthy and "Concerning" Livy Server for Spark 3s falls below a critical threshold, expressed as a percentage of the total number of Livy Server for Spark 3s. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Livy Server for Spark 3s, this test would return "Good" health if 95 or more Livy Server for Spark 3s have good health. This test would return "Concerning" health if at least 90 Livy Server for Spark 3s have either "Good" or "Concerning" health. If more than 10 Livy Server for Spark 3s have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Livy Server for Spark 3s. Check the status of the individual Livy Server for Spark 3s for more information. This test can be configured using the Livy for Spark 3 Livy for Spark 3 service-wide monitoring setting.

Short Name: Livy Server for Spark 3 Health

Healthy Livy Server for Spark 3 Monitoring Thresholds

Description

The health test thresholds of the overall Livy Server for Spark 3 health. The check returns "Concerning" health if the percentage of "Healthy" Livy Server for Spark 3s falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Livy Server for Spark 3s falls below the critical threshold.

MapReduce JobTracker Health

This is a MapReduce service-level health test that checks for and active, healthy JobTracker. The test returns "Bad" health if the service is running and an active JobTracker cannot be found. If an active JobTracker is found, then the test checks the health of that JobTracker as well as the health of any standby JobTracker configured. A "Good" health result will only be returned if both the active and Standby JobTrackers are healthy. A failure of this health test may indicate stopped or unhealthy JobTracker roles, or it may indicate a problem with communication between the Cloudera Manager Service Monitor and the JobTrackers. Check the status of the MapReduce service's JobTracker roles and look in the Cloudera Manager Service Monitor's log files for more information when this test fails. This test can be enabled or disabled using the JobTracker Role Health Test MapReduce service-wide monitoring setting. The check for a healthy standby JobTracker can be enabled or disabled with Standby JobTracker Health Test. In addition, the Active JobTracker Detection Window can be used to adjust the amount of time that the Cloudera Manager Service Monitor has to detect the active JobTracker before this health test fails, and the JobTracker Activation Startup Tolerance can be used to adjust the amount of time around JobTracker startup that the test allows for the JobTracker to be made active.

Short Name: JobTracker Health

Active JobTracker Detection Window

Description

Master Swap Memory Usage Rate Beta

This Master health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

```
process_swap_memory_rate_thresholds
```

Default Value

critical:never, warning:never

Unit(s)

BYTES

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

```
process_swap_memory_rate_window
```

Default Value

5

Unit(s)

MINUTES

Master Unexpected Exits

This Master health test checks that the Master has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical

threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Master monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

unexpected_exits_window

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

unexpected_exits_thresholds

Default Value

critical:any, warning:never

Unit(s)

no unit

Master Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate a problem with the web server of the Master, a misconfiguration of the Master, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the Master for more detail. If the test failure message indicates a communication problem, the Cloudera Manager Agent's HTTP requests to the Master's web server are failing or timing out. If the test's failure message indicates an unexpected response, the Master's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection Master monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Description

Enables the health test that the Cloudera Manager Agent can successfully contact and gather metrics from the web server.

Template Name

master_web_metric_collection_enabled

Default Value

true

Unit(s)

NameNode Pause Duration

This NameNode health test checks that the NameNode threads are not experiencing long scheduling pauses. The test uses a pause monitoring thread in the NameNode that tracks scheduling delay by noting if it is run on its requested schedule. If the thread is not run on its requested schedule, the delay is noted and considered pause time. The health test checks that no more than some percentage of recent time is spent paused. A failure of this health test may indicate that the NameNode is not getting enough CPU resources, or that it is spending too much time doing garbage collection. Inspect the NameNode logs for any pause monitor output and check garbage collection metrics exposed by the NameNode. This test can be configured using the Pause Duration Thresholds and Pause Duration Monitoring Period NameNode monitoring settings.

Short Name: Pause Duration

Pause Duration Monitoring Period

Description

The period to review when computing the moving average of extra time the pause monitor spent paused.

Template Name

namenode_pause_duration_window

Default Value

5

Unit(s)

MINUTES

Pause Duration Thresholds

Description

The health test thresholds for the weighted average extra time the pause monitor spent paused. Specified as a percentage of elapsed wall clock time.

NameNode Process Status

This NameNode health test checks that the Cloudera Manager Agent on the NameNode host is heart beating correctly and that the process associated with the NameNode role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the NameNode process, a lack of connectivity to the Cloudera Manager Agent on the NameNode host, or a problem with the Cloudera Manager Agent. This test can fail either because the NameNode has crashed or because the NameNode will not start or stop in a timely fashion. Check the NameNode logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the NameNode host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the NameNode host, or look in the Cloudera Manager Agent logs on the NameNode host for more details. This test can be enabled or disabled using the NameNode Process Health Test NameNode monitoring setting.

Short Name: Process Status

NameNode Process Health Test

Description

Enables the health test that the NameNode's process state is consistent with the role configuration

Template Name

namenode_scm_health_enabled

Default Value

true

Unit(s)

no unit

NameNode RPC Latency

This is a NameNode health test that checks that a moving average of the average time it takes for the NameNode to respond to requests does not exceed some value. A failure of this health test could indicate misconfiguration of the NameNode, that the NameNode is having a problem writing to one of its data directories, or may indicate a capacity planning problem. Check the NameNode's RpcQueueTime_avg_time and if this indicates that the bulk of the RPC latency is spent with requests queued, try increasing the NameNode Handler Count. If the NameNode's RpcProcessingTime_avg_time indicates the bulk of the RPC latency is due to request processing, check to see that each of the directories in which the HDFS metadata is being stored is performing adequately. This test can be configured using the NameNode RPC Latency Thresholds and NameNode RPC Latency Monitoring Window NameNode monitoring settings.

Short Name: RPC Latency

NameNode RPC Latency Monitoring Window

Description

The period to review when computing the moving average of the NameNode's RPC latency.

Template Name

namenode_rpc_latency_window

Default Value

5

Unit(s)

Navigator Thales KMS Proxy Health Tests

Navigator Thales KMS Proxy Audit Pipeline Test

This Navigator Thales KMS Proxy health test checks that the Auditing for the Navigator Thales KMS Proxy role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of Navigator Thales KMS Proxy process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the Navigator Thales KMS Proxy host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check Navigator Thales KMS Proxy monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

`mgmt_navigator_failure_window`

Default Value

20

Unit(s)

MINUTES

Navigator Audit Failure Thresholds

Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

mgmt_navigator_failure_thresholds

Default Value

critical:any, warning:never

Unit(s)

BYTES

Navigator Audit Pipeline Health Check

Description

Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

NodeManager NodeManager Health Checker

This is a NodeManager health test that checks whether the ResourceManager considers the NodeManager healthly.
A failure of this health test indicates that the NodeManager disk health checker or a health check script, if one
is configured, reported an unhealthy condition. The NodeManager health report may include more details about
the failure. Look in the NodeManager logs for more details. This test may return an unknown result if the Service
Monitor is not able to communicate with the ResourceManager web server. Check the status of the ResourceManager
web server and the Service Monitor logs if this test is returning an unknown result. This test can be enabled or
disabled using the NodeManager Health Checker Health Check NodeManager monitoring setting. The NodeManager
Connectivity Tolerance at Startup Node Manager monitoring setting and the Health Test Startup Tolerance
ResourceManager monitor setting can be used to control the test's tolerance windows around NodeManager and
ResourceManager restarts, respectively. The NodeManager disk health checker configuration can be configured using
Disk Health Checker Minimum Health Disks Fraction, Disk Health Checker Minimum Health Disk Space, and Dish
Health Checker Max Disk Utilization Percent.

Short Name: NodeManager Health Checker

Dish Health Checker Max Disk Utilization Percent

Description

> The maximum percentage of disk space utilization allowed after which a disk is marked as bad.
> Values can range from 0.0 to 100.0. If the value is greater than or equal to 100, the NodeManager
> will check for full disk. This applies to local directories and log directories.

Template Name

> `yarn_nodemanager_disk_health_checker_max_disk_utilization_per_disk_percentage`

Omid Health Tests

Omid tso server Health

This is a Omid service-level health test that checks that enough of the Omid tso servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Omid tso servers falls below a warning threshold, expressed as a percentage of the total number of Omid tso servers. The test returns "Bad" health if the number of healthy and "Concerning" Omid tso servers falls below a critical threshold, expressed as a percentage of the total number of Omid tso servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Omid tso servers, this test would return "Good" health if 95 or more Omid tso servers have good health. This test would return "Concerning" health if at least 90 Omid tso servers have either "Good" or "Concerning" health. If more than 10 Omid tso servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Omid tso servers. Check the status of the individual Omid tso servers for more information. This test can be configured using the Omid Omid service-wide monitoring setting.

Short Name: Omid tso server Health

Healthy Omid tso server Monitoring Thresholds

Description

The health test thresholds of the overall Omid tso server health. The check returns "Concerning" health if the percentage of "Healthy" Omid tso servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Omid tso servers falls below the critical threshold.

Template Name

Navigator Audit Failure Thresholds

Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

mgmt_navigator_failure_thresholds

Default Value

critical:any, warning:never

Unit(s)

BYTES

Navigator Audit Pipeline Health Check

Description

Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

mgmt_navigator_status_check_enabled

Default Value

true

Unit(s)

no unit

Omid tso server File Descriptors

This Omid tso server health test checks that the number of file descriptors used does not rise above some percentage of the Omid tso server file descriptor limit. A failure of this health test may indicate a bug in either Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor Monitoring Thresholds Omid tso server monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds

Description

The health test thresholds of the number of file descriptors used. Specified as a percentage of file descriptor limit.

Template Name

`omid_tso_fd_thresholds`

Default Value

critical:70.0, warning:50.0

Unit(s)

PERCENT

Omid tso server Host Health

This Omid tso server health test factors in the health of the host upon which the Omid tso server is running. A failure of this test means that the host running the Omid tso server is experiencing some problem. See that host's status page for more details.This test can be enabled or disabled using the Omid tso server Host Health Test Omid tso server monitoring setting.

Short Name: Host Health

Omid tso server Host Health Test

Description

When computing the overall Omid tso server health, consider the host's health.

Template Name

`omid_tso_host_health_enabled`

Default Value

true

Unit(s)

no unit

Omid tso server Log Directory Free Space

This Omid tso server health test checks that the filesystem containing the log directory of this Omid tso server has sufficient free space. This test can be configured using the Log Directory Free Space Monitoring Absolute Thresholds and Log Directory Free Space Monitoring Percentage Thresholds Omid tso server monitoring settings.

Short Name: Log Directory Free Space

Log Directory Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory.

Template Name

`log_directory_free_space_absolute_thresholds`

Default Value

critical:5.36870912E9, warning:1.073741824E10

Unit(s)

BYTES

Log Directory Free Space Monitoring Percentage Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a Log Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

```
log_directory_free_space_percentage_thresholds
```

Default Value

critical:never, warning:never

Unit(s)

PERCENT

Omid tso server Process Status

This Omid tso server health test checks that the Cloudera Manager Agent on the Omid tso server host is heart beating correctly and that the process associated with the Omid tso server role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Omid tso server process, a lack of connectivity to the Cloudera Manager Agent on the Omid tso server host, or a problem with the Cloudera Manager Agent. This test can fail either because the Omid tso server has crashed or because the Omid tso server will not start or stop in a timely fashion. Check the Omid tso server logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Omid tso server host, check the status of the Cloudera Manager Agent by running / etc/init.d/cloudera-scm-agent status on the Omid tso server host, or look in the Cloudera Manager Agent logs on the Omid tso server host for more details. This test can be enabled or disabled using the Omid tso server Process Health Test Omid tso server monitoring setting.

Short Name: Process Status

Omid tso server Process Health Test

Description

Enables the health test that the Omid tso server's process state is consistent with the role configuration

Template Name

```
omid_tso_scm_health_enabled
```

Default Value

true

Unit(s)

no unit

Omid tso server Swap Memory Usage

This Omid tso server health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

```
                process_swap_memory_thresholds
```
Default Value

        critical:never, warning:200.0

Unit(s)

        BYTES

Omid tso server Swap Memory Usage Rate Beta

This Omid tso server health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

        The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

        process_swap_memory_rate_thresholds

Default Value

        critical:never, warning:never

Unit(s)

Default Value

critical:any, warning:never

Unit(s)

no unit

Oozie Health Tests

Oozie Server Health

This is a Oozie service-level health test that checks that enough of the Oozie Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Oozie Servers falls below a warning threshold, expressed as a percentage of the total number of Oozie Servers. The test returns "Bad" health if the number of healthy and "Concerning" Oozie Servers falls below a critical threshold, expressed as a percentage of the total number of Oozie Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Oozie Servers, this test would return "Good" health if 95 or more Oozie Servers have good health. This test would return "Concerning" health if at least 90 Oozie Servers have either "Good" or "Concerning" health. If more than 10 Oozie Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Oozie Servers. Check the status of the individual Oozie Servers for more information. This test can be configured using the Oozie Oozie service-wide monitoring setting.

Short Name: Oozie Server Health

Healthy Oozie Server Monitoring Thresholds

Description

The health test thresholds of the overall Oozie Server health. The check returns "Concerning" health if the percentage of "Healthy" Oozie Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Oozie Servers falls below the critical threshold.

Template Name

`oozie_servers_healthy_thresholds`

Default Value

critical:51.0, warning:99.0

Oozie Server Callable Queue Size

This is an Oozie Server health test that checks that a moving average of the size of the Oozie Server's callable queue does not exceed some percentage of the configured maximum size for the queue. The callable queue contains tasks (e.g., StartCommand task, ActionCommand task) for asynchronous execution. When the queue is full the callable queue service stops queuing tasks. This may cause running jobs and submissions of new jobs to fail. A failure of this health test indicates a high load on the Oozie Server. Make sure the Oozie server has enough heap and is not running out of memory. You can also increase the number of threads handling the callable queue items by changing Number Threads For Executing Callables and the max size of the callable queue by changing Maximum Callable Queue Size. This test can be configured using the Oozie Server Callable Queue Monitoring Threshold and Oozie Server Callable Queue Monitoring Period Oozie Server monitoring settings.

Short Name: Callable Queue Size

> no unit

Oozie Server Pause Duration

This Oozie Server health test checks that the Oozie Server threads are not experiencing long scheduling pauses. The test uses a pause monitoring thread in the Oozie Server that tracks scheduling delay by noting if it is run on its requested schedule. If the thread is not run on its requested schedule, the delay is noted and considered pause time. The health test checks that no more than some percentage of recent time is spent paused. A failure of this health test may indicate that the Oozie Server is not getting enough CPU resources, or that it is spending too much time doing garbage collection. Inspect the Oozie Server logs for any pause monitor output and check garbage collection metrics exposed by the Oozie Server. This test can be configured using the Pause Duration Thresholds and Pause Duration Monitoring Period Oozie Server monitoring settings.

Short Name: Pause Duration

Pause Duration Monitoring Period

Description

> The period to review when computing the moving average of extra time the pause monitor spent paused.

Template Name

> ```
> oozie_server_pause_duration_window

Ozone DataNode Process Status

This Ozone DataNode health test checks that the Cloudera Manager Agent on the Ozone DataNode host is heart beating correctly and that the process associated with the Ozone DataNode role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Ozone DataNode process, a lack of connectivity to the Cloudera Manager Agent on the Ozone DataNode host, or a problem with the Cloudera Manager Agent. This test can fail either because the Ozone DataNode has crashed or because the Ozone DataNode will not start or stop in a timely fashion. Check the Ozone DataNode logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Ozone DataNode host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Ozone DataNode host, or look in the Cloudera Manager Agent logs on the Ozone DataNode host for more details. This test can be enabled or disabled using the Ozone DataNode Process Health Test Ozone DataNode monitoring setting.

Short Name: Process Status

Ozone DataNode Process Health Test

Description

Enables the health test that the Ozone DataNode's process state is consistent with the role configuration

Template Name

`ozone_datanode_scm_health_enabled`

Default Value

true

Unit(s)

no unit

Ozone DataNode Swap Memory Usage

This Ozone DataNode health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

`process_swap_memory_thresholds`

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

Ozone DataNode Swap Memory Usage Rate Beta

This Ozone DataNode health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be

configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Passive Database Unexpected Exits

This Passive Database health test checks that the Passive Database has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Passive Database monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

`unexpected_exits_window`

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

Passive Key Trustee Server Health Tests

Passive Key Trustee Server Audit Pipeline Test

This Passive Key Trustee Server health test checks that the Auditing for the Passive Key Trustee Server role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of Passive Key Trustee Server process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the Passive Key Trustee Server host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check Passive Key Trustee Server monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

       The period to review when checking if audits are blocked and not getting processed.

Template Name

```
        mgmt_navigator_failure_window
```

Default Value

       20

Unit(s)

       MINUTES

Navigator Audit Failure Thresholds

Description

       The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

```
        mgmt_navigator_failure_thresholds
```

Default Value

       critical:any, warning:never

Unit(s)

       BYTES

Navigator Audit Pipeline Health Check

Description

       Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

```
mgmt_navigator_status_check_enabled
```

Default Value

true

Unit(s)

no unit

Passive Key Trustee Server File Descriptors

This Passive Key Trustee Server health test checks that the number of file descriptors used does not rise above some percentage of the Passive Key Trustee Server file descriptor limit. A failure of this health test may indicate a bug in either Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor Monitoring Thresholds Passive Key Trustee Server monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds

Description

The health test thresholds of the number of file descriptors used. Specified as a percentage of file descriptor limit.

Template Name

```
keytrustee_passive_server_fd_thresholds
```

Default Value

critical:70.0, warning:50.0

Unit(s)

Phoenix Health Tests

Phoenix Query Server Health

This is a Phoenix service-level health test that checks that enough of the Query Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Query Servers falls below a warning threshold, expressed as a percentage of the total number of Query Servers. The test returns "Bad" health if the number of healthy and "Concerning" Query Servers falls below a critical threshold, expressed as a percentage of the total number of Query Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Query Servers, this test would return "Good" health if 95 or more Query Servers have good health. This test would return "Concerning" health if at least 90 Query Servers have either "Good" or "Concerning" health. If more than 10 Query Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Query Servers. Check the status of the individual Query Servers for more information. This test can be configured using the Phoenix Phoenix service-wide monitoring setting.

Short Name: Query Server Health

Healthy Query Server Monitoring Thresholds

Description

> The health test thresholds of the overall Query Server health. The check returns "Concerning" health if the percentage of "Healthy" Query Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Query Servers falls below the critical threshold.

Template Name

Ranger Health Tests

Ranger Admin Health

This is a Ranger service-level health test that checks that enough of the Ranger Admins in the cluster are healthy. The test returns "Concerning" health if the number of healthy Ranger Admins falls below a warning threshold, expressed as a percentage of the total number of Ranger Admins. The test returns "Bad" health if the number of healthy and "Concerning" Ranger Admins falls below a critical threshold, expressed as a percentage of the total number of Ranger Admins. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Ranger Admins, this test would return "Good" health if 95 or more Ranger Admins have good health. This test would return "Concerning" health if at least 90 Ranger Admins have either "Good" or "Concerning" health. If more than 10 Ranger Admins have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Ranger Admins. Check the status of the individual Ranger Admins for more information. This test can be configured using the Ranger Ranger service-wide monitoring setting.

Short Name: Ranger Admin Health

Healthy Ranger Admin Monitoring Thresholds

Description

The health test thresholds of the overall Ranger Admin health. The check returns "Concerning" health if the percentage of "Healthy" Ranger Admins falls below the warning threshold. Ranger KMS Server Health Tests

Ranger KMS Server Audit Pipeline Test

This Ranger KMS Server health test checks that the Auditing for the Ranger KMS Server role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of Ranger KMS Server process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the Ranger KMS Server host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check Ranger KMS Server monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

mgmt_navigator_failure_window

Default Value

20

Unit(s)

MINUTES

Navigator Audit Failure Thresholds
Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

`mgmt_navigator_failure_thresholds`

Default Value

critical:any, warning:never

Unit(s)

BYTES

Navigator Audit Pipeline Health Check
Description

Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

`mgmt_navigator_status_check_enabled`

Default Value

true

Unit(s)

no unit

Ranger KMS Server File Descriptors

This Ranger KMS Server health test checks that the number of file descriptors used does not rise above some percentage of the Ranger KMS Server file descriptor limit. A failure of this health test may indicate a bug in either Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor Monitoring Thresholds Ranger KMS Server monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds
Description

The health test thresholds of the number of file descriptors used. Specified as a percentage of file descriptor limit.

Template Name

`ranger_kms_server_fd_thresholds`

Default Value

critical:70.0, warning:50.0

Unit(s)

PERCENT

Ranger KMS Server Host Health

This Ranger KMS Server health test factors in the health of the host upon which the Ranger KMS Server is running. A failure of this test means that the host running the Ranger KMS Server is experiencing some problem. See that host's status page for more details.This test can be enabled or disabled using the Ranger KMS Server Host Health Test Ranger KMS Server monitoring setting.

Short Name: Host Health

Ranger KMS Server Host Health Test

Description

When computing the overall Ranger KMS Server health, consider the host's health.

Template Name

```
ranger_kms_server_host_health_enabled
```

Default Value

true

Unit(s)

no unit

Ranger KMS Server Log Directory Free Space

This Ranger KMS Server health test checks that the filesystem containing the log directory of this Ranger KMS Server has sufficient free space. This test can be configured using the Log Directory Free Space Monitoring Absolute Thresholds and Log Directory Free Space Monitoring Percentage Thresholds Ranger KMS Server monitoring settings.

Short Name: Log Directory Free Space

Log Directory Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory.

Template Name

```
log_directory_free_space_absolute_thresholds
```

Default Value

critical:5.36870912E9, warning:1.073741824E10

Unit(s)

BYTES

Log Directory Free Space Monitoring Percentage Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a Log Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

```
log_directory_free_space_percentage_thresholds
```

Default Value

critical:never, warning:never

Unit(s)

PERCENT

Ranger KMS Server Process Status

This Ranger KMS Server health test checks that the Cloudera Manager Agent on the Ranger KMS Server host is heart beating correctly and that the process associated with the Ranger KMS Server role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Ranger KMS Server process, a lack of connectivity to the Cloudera Manager Agent on the Ranger KMS Server host, or a problem with the Cloudera Manager Agent. This test can fail either because the Ranger KMS Server has crashed or because the Ranger KMS Server will not start or stop in a timely fashion. Check the Ranger KMS Server logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Ranger KMS Server host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Ranger KMS Server host, or look in the Cloudera Manager Agent logs on the Ranger KMS Server host for more details. This test can be enabled or disabled using the Ranger KMS Server Process Health Test Ranger KMS Server monitoring setting.

Short Name: Process Status

Ranger KMS Server Process Health Test

Description

Enables the health test that the Ranger KMS Server's process state is consistent with the role configuration

Template Name

ranger_kms_server_scm_health_enabled

Default Value

true

Unit(s)

no unit

Ranger KMS Server Ranger KMS URL Canary Check

This is a Ranger KMS Server role-level status test that checks whether the Ranger KMS Server URL is reachable or not. A failure of this health check indicates that Ranger KMS Server URL is not reachable.

Short Name: Ranger KMS URL Canary Check

Ranger KMS Server Swap Memory Usage

This Ranger KMS Server health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

process_swap_memory_thresholds

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

Ranger KMS Server Swap Memory Usage Rate Beta

This Ranger KMS Server health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

```
process_swap_memory_rate_thresholds
```

Default Value

critical:never, warning:never

Unit(s)

BYTES

Swap Memory Usage Rate Window

Template Name

> `log_directory_free_space_percentage_thresholds`

Default Value

> critical:never, warning:never

Unit(s)

> PERCENT

Ranger Raz Server Process Status

This Ranger Raz Server health test checks that the Cloudera Manager Agent on the Ranger Raz Server host is heart beating correctly and that the process associated with the Ranger Raz Server role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Ranger Raz Server process, a lack of connectivity to the Cloudera Manager Agent on the Ranger Raz Server host, or a problem with the Cloudera Manager Agent. This test can fail either because the Ranger Raz Server has crashed or because the Ranger Raz Server will not start or stop in a timely fashion. Check the Ranger Raz Server logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Ranger Raz Server host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Ranger Raz Server host, or look in the Cloudera Manager Agent logs on the Ranger Raz Server host for more details. This test can be enabled or disabled using the Ranger Raz Server Process Health Test Ranger Raz Server monitoring setting.

Short Name: Process Status

Ranger Raz Server Process Health Test

Description

Enables the health test that the Ranger Raz Server's process state is consistent with the role configuration

Template Name

`ranger_raz_server_scm_health_enabled`

Default Value

PERCENT

RegionServer Memstore Size

This is a RegionServer health test that checks that the amount of the RegionServer's memory devoted to memstores does not exceed some percentage of the RegionServer's configured hbase.regionserver.global.memstore.upperLimit. When a RegionServer's memstores reach this maximum size, new updates are blocked while the RegionServer flushes. A failure of this health test indicates a high write load on the RegionServer. Try reducing the write load

on the RegionServer, increasing capacity by adding additional disks to the RegionServer, or adding additional RegionServers. This test can be configured using the HBase RegionServer Memstore Size Thresholds RegionServer monitoring setting.

Short Name: Memstore Size

HBase RegionServer Memstore Size Thresholds

Description

The health test thresholds of the total size of RegionServer's memstores. Specified as a percentage of the configured upper limit. See Maximum Size of All Memstores in RegionServer.

Template Name

`regionserver_memstore_size_thresholds`

Default Value

critical:100.0, warning:95.0

Unit(s)

PERCENT

RegionServer Process Status

This RegionServer health test checks that the Cloudera Manager Agent on the RegionServer host is heart beating correctly and that the process associated with the RegionServer role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the RegionServer process, a lack of connectivity to the Cloudera Manager Agent on the RegionServer host, or a problem with the Cloudera Manager Agent. This test can fail either because the RegionServer has crashed or because the RegionServer will not start or stop in a timely fashion. Check the RegionServer logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the RegionServer host, check the status of the Cloudera Manager Agent by running / etc/init.d/cloudera-scm-agent status on the RegionServer host, or look in the Cloudera Manager Agent logs on the RegionServer host for more details. This test can be enabled or disabled using the RegionServer Process Health Test RegionServer monitoring setting.

Short Name: Process Status

RegionServer Process Health Test

Description

Enables the health test that the RegionServer's process state is consistent with the role configuration

Template Name

`regionserver_scm_health_enabled`

Default Value

true

Unit(s)

no unit

RegionServer Store File Index Size

This is a RegionServer health test that checks that the sum of the sizes of all store file indexes does not exceed some percentage of the RegionServer's maximum heap size. A failure of this health test indicates that the RegionServer is using a significant portion of its memory for store file indexes. If the amount of memory devoted to these indexes is undesirably high, the size of indexes can be reduced by increasing the HBase block size, by using smaller key values, or by using fewer columns.. Each of these choices involves trade-offs. Contact Cloudera Support for more information on this topic. This test can be configured using the Percentage of Heap Used by HStoreFile Index RegionServer monitoring setting.

Short Name: Store File Index Size

Percentage of Heap Used by HStoreFile Index

Description

The health test thresholds of the size used by the HStoreFile index. Specified as a percentage of the total heap size.

Template Name

`regionserver_store_file_idx_size_thresholds`

Default Value

critical:never, warning:10.0

Unit(s)

PERCENT

RegionServer Swap Memory Usage

This RegionServer health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

`process_swap_memory_thresholds`

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

RegionServer Swap Memory Usage Rate Beta

This RegionServer health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

`process_swap_memory_rate_thresholds`

Default Value

Reports Manager Cloudera Manager Descriptor Age

This is a Reports Manager health test that checks if the Cloudera Manager descriptor has been refreshed recently.
The Cloudera Manager descriptor is used to pass configuration information from the Cloudera Manager Server to
the Reports Manager. If the descriptor becomes stale, Reports Manager operation may be impacted because the
Reports Manager will receive information about new hosts, roles, and services, or changes to existing hosts, roles,
and services. A stale descriptor usually indicates problems communicating with the Cloudera Manager Server but can
also indicate performance problems or a bug. Consult the Reports Manager log and the Cloudera Manager Server log
for more information. This test can be configured using the Cloudera Manager Descriptor Age Thresholds Cloudera
Manager Reports Manager setting.

Short Name: Cloudera Manager Descriptor Age

Cloudera Manager Descriptor Age Thresholds

Description

>   The health test thresholds for monitoring the time since the Cloudera Manager descriptor was last
>   refreshed.

Template Name

>   `scm_descriptor_age_thresholds`

Schema Registry Health Tests

Schema Registry Server Health

This is a Schema Registry service-level health test that checks that enough of the Schema Registry Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Schema Registry Servers falls below a warning threshold, expressed as a percentage of the total number of Schema Registry Servers. The test returns "Bad" health if the number of healthy and "Concerning" Schema Registry Servers falls below a critical threshold, expressed as a percentage of the total number of Schema Registry Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Schema Registry Servers, this test would return "Good" health if 95 or more Schema Registry Servers have good health. This test would return "Concerning" health if at least 90 Schema Registry Servers have either "Good" or "Concerning" health. If more than 10 Schema Registry Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Schema Registry Servers. Check the status of the individual Schema Registry Servers for more information. This test can be configured using the Schema Registry Schema Registry service-wide monitoring setting.

Short Name: Schema Registry Server Health

Healthy Schema Registry Server Monitoring Thresholds

Description

The health test thresholds of the overall Schema Registry Server health. The check returns "Concerning" health if the percentage of "Healthy" Schema Registry Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Schema Registry Servers falls below the critical threshold.

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

unexpected_exits_thresholds

Default Value

critical:any, warning:never

Unit(s)

no unit

SecondaryNameNode Health Tests

SecondaryNameNode Audit Pipeline Test

This SecondaryNameNode health test checks that the Auditing for the SecondaryNameNode role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of SecondaryNameNode process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the SecondaryNameNode host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check SecondaryNameNode monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

mgmt_navigator_failure_window

Default Value

20

Unit(s)

MINUTES

Navigator Audit Failure Thresholds

Description

The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

    mgmt_navigator_failure_thresholds

Default Value

    critical:any, warning:never

Unit(s)

    BYTES

Navigator Audit Pipeline Health Check

Description

    Enable test of audit events processing pipeline. This will test if audit events are not getting
    processed by Audit Server for a role that generates audit.

Template Name

    mgmt_navigator_status_check_enabled

Default Value

    true

Unit(s)

    no unit

SecondaryNameNode File Descriptors

This SecondaryNameNode health test checks that the number of file descriptors used does not rise above some
percentage of the SecondaryNameNode file descriptor limit. A failure of this health test may indicate a bug in either
Hadoop or Cloudera Manager. Contact Cloudera support. This test can be configured using the File Descriptor
Monitoring Thresholds SecondaryNameNode monitoring setting.

Short Name: File Descriptors

File Descriptor Monitoring Thresholds

Description

    The health test thresholds of the number of file descriptors used. Specified as a percentage of file
    descriptor limit.

Template Name

    secondarynamenode_fd_thresholds

Default Value

    critical:70.0, warning:50.0

Unit(s)

    PERCENT

SecondaryNameNode GC Duration

This SecondaryNameNode health test checks that the SecondaryNameNode is not spending too much time
performing Java garbage collection. It checks that no more than some percentage of recent time is spent performing
Java garbage collection. A failure of this health test may indicate a capacity planning problem or misconfiguration of
the SecondaryNameNode. This test can be configured using the Garbage Collection Duration Thresholds and Garbage
Collection Duration Monitoring Period SecondaryNameNode monitoring settings.

Short Name: GC Duration

Garbage Collection Duration Monitoring Period

Description

The period to review when computing the moving average of garbage collection time.

Template Name

secondarynamenode_gc_duration_window

Default Value

5

Unit(s)

MINUTES

Garbage Collection Duration Thresholds

Description

The health test thresholds for the weighted average time spent in Java garbage collection. Specified as a percentage of elapsed wall clock time.

Template Name

secondarynamenode_gc_duration_thresholds

Default Value

critical:60.0, warning:30.0

Unit(s)

no unit

SecondaryNameNode HDFS Checkpoint Directories Free Space

This is a SecondaryNameNode health test that checks that the filesystem containing the HDFS Checkpoint Directories of this SecondaryNameNode has sufficient free space. See the HDFS Checkpoint Directories description on the SecondaryNameNode configuration page for more information on this directory type. This test can be configured using the HDFS Checkpoint Directories Free Space Monitoring Absolute Thresholds and HDFS Checkpoint Directories Free Space Monitoring Percentage Thresholds SecondaryNameNode monitoring settings.

Short Name: HDFS Checkpoint Directories Free Space

HDFS Checkpoint Directories Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's HDFS Checkpoint Directories.

Template Name

secondarynamenode_checkpoint_directories_free_space_absolute_thresholds

Default Value

critical:5.36870912E9, warning:1.073741824E10

Unit(s)

BYTES

HDFS Checkpoint Directories Free Space Monitoring Percentage Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's HDFS Checkpoint Directories. Specified as a percentage of the capacity on that filesystem. This setting is not used if a HDFS Checkpoint Directories Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

secondarynamenode_checkpoint_directories_free_space_percentage_thresholds

Default Value

SecondaryNameNode Process Status

This SecondaryNameNode health test checks that the Cloudera Manager Agent on the SecondaryNameNode host is heart beating correctly and that the process associated with the SecondaryNameNode role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the SecondaryNameNode process, a lack of connectivity to the Cloudera Manager Agent on the SecondaryNameNode host, or a problem with the Cloudera Manager Agent. This test can fail either because the SecondaryNameNode has crashed or because the SecondaryNameNode will not start or stop in a timely fashion. Check the SecondaryNameNode logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the SecondaryNameNode host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the SecondaryNameNode host, or look in the Cloudera Manager Agent logs on the SecondaryNameNode

host for more details. This test can be enabled or disabled using the SecondaryNameNode Process Health Test SecondaryNameNode monitoring setting.

Short Name: Process Status

SecondaryNameNode Process Health Test

Description

Enables the health test that the SecondaryNameNode's process state is consistent with the role configuration

Template Name

`secondarynamenode_scm_health_enabled`

Default Value

true

Unit(s)

no unit

SecondaryNameNode Swap Memory Usage

This SecondaryNameNode health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

`process_swap_memory_thresholds`

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

SecondaryNameNode Swap Memory Usage Rate Beta

This SecondaryNameNode health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

`process_swap_memory_rate_thresholds`

Default Value

critical:never, warning:never

Unit(s)

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

`process_swap_memory_rate_window`

Default Value

5

Unit(s)

MINUTES

SecondaryNameNode Unexpected Exits

This SecondaryNameNode health test checks that the SecondaryNameNode has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period SecondaryNameNode monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

`unexpected_exits_window`

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

`unexpected_exits_thresholds`

Default Value

critical:any, warning:never

Unit(s)

no unit

SecondaryNameNode Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate a problem with the web server of the SecondaryNameNode, a misconfiguration of the SecondaryNameNode, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the SecondaryNameNode for more detail. If the test failure message indicates a communication problem, the Cloudera Manager Agent's HTTP requests to the SecondaryNameNode's web server are failing or timing out. If the test's failure message indicates an unexpected response, the SecondaryNameNode's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection SecondaryNameNode monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Description

Enables the health test that the Cloudera Manager Agent can successfully contact and gather metrics from the web server.

Template Name

`secondarynamenode_web_metric_collection_enabled`

Default Value

true

Unit(s)

Sentry Health Tests

Sentry Server Health

This is a Sentry service-level health test that checks that enough of the Sentry Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Sentry Servers falls below a warning threshold, expressed as a percentage of the total number of Sentry Servers. The test returns "Bad" health if the number of healthy and "Concerning" Sentry Servers falls below a critical threshold, expressed as a percentage of the total number of Sentry Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Sentry Servers, this test would return "Good" health if 95 or more Sentry Servers have good health. This test would return "Concerning" health if at least 90 Sentry Servers have either "Good" or "Concerning" health. If more than 10 Sentry Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Sentry Servers. Check the status of the individual Sentry Servers for more information. This test can be configured using the Sentry Sentry service-wide monitoring setting.

Short Name: Sentry Server Health

Healthy Sentry Server Monitoring Thresholds

Description

> The health test thresholds of the overall Sentry Server health. The check returns "Concerning" health if the percentage of "Healthy" Sentry Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Sentry Servers falls below the critical threshold.

Template Name

Service Monitor Metrics Aggregation Run Duration Test

This is a Service Monitor health test that checks whether Cloudera Manager's aggregation run durations are within the thresholds. If the test fails, Service Monitor operation may be impacted because the Service Monitor is not able to process the metrics fast enough. You can also turn off "Enable Metric Collection" setting for services that generate lot of metrics such as Hbase, Solr etc.. This test can be configured using the Metrics Aggregation Run Duration Thresholds Cloudera Manager Service Monitor setting.

It is safe to increase these thresholds if a Concerning● or Bad status is reported often, as long as they remain less than or equal to the aggregation period (one minute by default). If other measures have failed to address the issue satisfactorily, then Cloudera recommends setting the critical threshold to 60 seconds, and the warning threshold to 45 seconds.

Short Name: Metrics Aggregation Run Duration Test

Metrics Aggregation Run Duration Thresholds

Description

The health test thresholds for monitoring the metrics aggregation run duration.

Template Name

aggregation_run_duration_thresholds

Default Value

critical:30000.0, warning:10000.0

Unit(s)

MILLISECONDS

Service Monitor Pause Duration

This Service Monitor health test checks that the Service Monitor threads are not experiencing long scheduling pauses. The test uses a pause monitoring thread in the Service Monitor that tracks scheduling delay by noting if it is run on its requested schedule. If the thread is not run on its requested schedule, the delay is noted and considered pause time. The health test checks that no more than some percentage of recent time is spent paused. A failure of this health test may indicate that the Service Monitor is not getting enough CPU resources, or that it is spending too much time doing garbage collection. Inspect the Service Monitor logs for any pause monitor output and check garbage collection metrics exposed by the Service Monitor. This test can be configured using the Pause Duration Thresholds and Pause Duration Monitoring Period Service Monitor monitoring settings.

Short Name: Pause Duration

Pause Duration Monitoring Period

Description

The period to review when computing the moving average of extra time the pause monitor spent paused.

Template Name

servicemonitor_pause_duration_window

Default Value

5

Unit(s)

MINUTES

Pause Duration Thresholds

Description

The health test thresholds for the weighted average extra time the pause monitor spent paused. Specified as a percentage of elapsed wall clock time.

Template Name

servicemonitor_pause_duration_thresholds

Default Value

critical:60.0, warning:30.0

Unit(s)

no unit

Service Monitor Process Status

This Service Monitor health test checks that the Cloudera Manager Agent on the Service Monitor host is heart beating correctly and that the process associated with the Service Monitor role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Service Monitor process, a lack of connectivity to the Cloudera Manager Agent on the Service Monitor host, or a problem with the Cloudera Manager Agent. This test can fail either because the Service Monitor has crashed or because the Service Monitor will not start or stop in a timely fashion. Check the Service Monitor logs for more details. If the test fails because of problems communicating

with the Cloudera Manager Agent on the Service Monitor host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Service Monitor host, or look in the Cloudera Manager Agent logs on the Service Monitor host for more details. This test can be enabled or disabled using the Service Monitor Process Health Test Service Monitor monitoring setting.

Short Name: Process Status

Service Monitor Process Health Test

Description

Enables the health test that the Service Monitor's process state is consistent with the role configuration

Template Name

servicemonitor_scm_health_enabled

Default Value

true

Unit(s)

Unit(s)

> no unit

Service Monitor Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate a problem with the web server of the Service Monitor, a misconfiguration of the Service Monitor, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the Service Monitor for more detail. If the test failure message indicates a communication problem, the Cloudera Manager Agent's HTTP requests to the Service Monitor's web server are failing or timing out. If the test's failure message indicates an unexpected response, the Service Monitor's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection Service Monitor monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Description

> Enables the health test that the Cloudera Manager Agent can successfully contact and gather metrics from the web server.

Template Name

> servicemonitor_web_metric_collection_enabled

Default Value

Solr Health Tests

Solr Server Health

This is a Solr service-level health test that checks that enough of the Solr Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Solr Servers falls below a warning threshold, expressed as a percentage of the total number of Solr Servers. The test returns "Bad" health if the number of healthy and "Concerning" Solr Servers falls below a critical threshold, expressed as a percentage of the total number of Solr Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Solr Servers, this test would return "Good" health if 95 or more Solr Servers have good health. This test would return "Concerning" health if at least 90 Solr Servers have either "Good" or "Concerning" health. If more than 10 Solr Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Solr Servers. Check the status of the individual Solr Servers for more information. This test can be configured using the Solr Solr service-wide monitoring setting.

Short Name: Solr Server Health

Healthy Solr Server Monitoring Thresholds

Description

The health test thresholds of the overall Solr Server health. The check returns "Concerning" health if the percentage of "Healthy" Solr Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Solr Servers falls below the critical threshold.

Template Name

Sqoop 2 Server Process Status

This Sqoop 2 Server health test checks that the Cloudera Manager Agent on the Sqoop 2 Server host is heart beating correctly and that the process associated with the Sqoop 2 Server role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Sqoop 2 Server process, a lack of connectivity to the Cloudera Manager Agent on the Sqoop 2 Server host, or a problem with the Cloudera Manager Agent. This test can fail either because the Sqoop 2 Server has crashed or because the Sqoop 2 Server will not start or stop in a timely fashion. Check the Sqoop 2 Server logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Sqoop 2 Server host, check the status of the Cloudera Manager Agent by running / etc/init.d/cloudera-scm-agent status on the Sqoop 2 Server host, or look in the Cloudera Manager Agent logs on the Sqoop 2 Server host for more details. This test can be enabled or disabled using the Sqoop 2 Server Process Health Test Sqoop 2 Server monitoring setting.

This is a TaskTracker health test that checks whether the JobTracker considers the TaskTracker alive. A failure of this health test may indicate that the TaskTracker is having trouble communicating with the JobTracker. Look in the TaskTracker logs for more details. This test can be enabled or disabled using the TaskTracker Connectivity Health Test TaskTracker monitoring setting. The TaskTracker Connectivity Tolerance at Startup TaskTracker monitoring setting and the Health Test Startup Tolerance JobTracker monitoring setting can be used to control the test's tolerance windows around TaskTracker and JobTracker restarts respectively.

Short Name: JobTracker Connectivity

Health Test Startup Tolerance

Description

The amount of time allowed after this role is started that failures of health tests that rely on communication with this role will be tolerated.

Template Name

`jobtracker_startup_tolerance`

Default Value

5

Unit(s)

MINUTES

TaskTracker Connectivity Health Test
Description

Enables the health test that the TaskTracker is connected to the JobTracker

Template Name

tasktracker_connectivity_health_enabled

Default Value

true

Unit(s)

no unit

TaskTracker Connectivity Tolerance at Startup
Description

The amount of time to wait for the TaskTracker to fully start up and connect to the JobTracker before enforcing the connectivity check.

Template Name

tasktracker_connectivity_tolerance

Default Value

180

Unit(s)

SECONDS

TaskTracker Log Directory Free Space

This TaskTracker health test checks that the filesystem containing the log directory of this TaskTracker has sufficient free space. This test can be configured using the Log Directory Free Space Monitoring Absolute Thresholds and Log Directory Free Space Monitoring Percentage Thresholds TaskTracker monitoring settings.

Short Name: Log Directory Free Space

Log Directory Free Space Monitoring Absolute Thresholds
Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory.

Template Name

log_directory_free_space_absolute_thresholds

Default Value

critical:5.36870912E9, warning:1.073741824E10

Unit(s)

BYTES

Log Directory Free Space Monitoring Percentage Thresholds
Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's log directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a Log Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

```
log_directory_free_space_percentage_thresholds
```

Default Value

> critical:never, warning:never

Unit(s)

> PERCENT

TaskTracker Process Status

This TaskTracker health test checks that the Cloudera Manager Agent on the TaskTracker host is heart beating correctly and that the process associated with the TaskTracker role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the TaskTracker process, a lack of connectivity to the Cloudera Manager Agent on the TaskTracker host, or a problem with the Cloudera Manager Agent. This test can fail either because the TaskTracker has crashed or because the TaskTracker will not start or stop in a timely fashion. Check the TaskTracker logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the TaskTracker host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the TaskTracker host, or look in the Cloudera Manager Agent logs on the TaskTracker host for more details. This test can be enabled or disabled using the TaskTracker Process Health Test TaskTracker monitoring setting.

Short Name: Process Status

TaskTracker Process Health Test

Description

> Enables the health test that the TaskTracker's process state is consistent with the role configuration

Template Name

> ```
> tasktracker_scm_health_enabled
> ```

Default Value

> true

Unit(s)

> no unit

TaskTracker Swap Memory Usage

This TaskTracker health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

> The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

> ```
> process_swap_memory_thresholds
> ```

Default Value

> critical:never, warning:200.0

Unit(s)

> BYTES

TaskTracker Swap Memory Usage Rate Beta

This TaskTracker health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

```
process_swap_memory_rate_thresholds
```

Default Value

critical:never, warning:never

Unit(s)

BYTES

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

```
process_swap_memory_rate_window
```

Default Value

5

Unit(s)

MINUTES

TaskTracker TaskTracker Local Data Directories Free Space

This is a TaskTracker health test that checks that the filesystem containing the TaskTracker Local Data Directories of this TaskTracker has sufficient free space. See the TaskTracker Local Data Directories description on the TaskTracker configuration page for more information on this directory type. This test can be configured using the TaskTracker Local Data Directories Free Space Monitoring Absolute Thresholds and TaskTracker Local Data Directories Free Space Monitoring Percentage Thresholds TaskTracker monitoring settings.

Short Name: TaskTracker Local Data Directories Free Space

TaskTracker Local Data Directories Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's TaskTracker Local Data Directories.

Template Name

```
tasktracker_local_data_directories_free_space_absolute_thresholds
```

Default Value

critical:5.36870912E9, warning:1.073741824E10

Unit(s)

BYTES

TaskTracker Local Data Directories Free Space Monitoring Percentage Thresholds

Description

> The health test thresholds for monitoring of free space on the filesystem that contains this role's TaskTracker Local Data Directories. Specified as a percentage of the capacity on that filesystem. This setting is not used if a TaskTracker Local Data Directories Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

> `tasktracker_local_data_directories_free_space_percentage_thresholds`

Default Value

> critical:never, warning:never

Unit(s)

> PERCENT

TaskTracker Unexpected Exits

This TaskTracker health test checks that the TaskTracker has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period TaskTracker monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

> The period to review when computing unexpected exits.

Template Name

> `unexpected_exits_window`

Default Value

> 5

Unit(s)

> MINUTES

Unexpected Exits Thresholds

Description

> The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

> `unexpected_exits_thresholds`

Default Value

> critical:any, warning:never

Unit(s)

> no unit

TaskTracker Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate

a problem with the web server of the TaskTracker, a misconfiguration of the TaskTracker, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the TaskTracker for more detail. If the test failure message indicates a communication problem, the Cloudera Manager Agent's HTTP requests to the TaskTracker's web server are failing or timing out. If the test's failure message indicates an unexpected response, the TaskTracker's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection TaskTracker monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Description

Enables the health test that the Cloudera Manager Agent can successfully contact and gather metrics from the web server.

Template Name

`tasktracker_web_metric_collection_enabled`

Default Value

true

Unit(s)

no unit

Web Metric Collection Duration

Description

The health test thresholds on the duration of the metrics request to the web server.

Template Name

`tasktracker_web_metric_collection_thresholds`

Default Value

critical:never, warning:10000.0

Unit(s)

MILLISECONDS

Telemetry Publisher Health Tests

Telemetry Publisher Audit Pipeline Test

This Telemetry Publisher health test checks that the Auditing for the Telemetry Publisher role is getting processed correctly and is not blocked. A failure of this health test may indicate a problem with the audit pipeline of Telemetry Publisher process. This test can fail either because the Cloudera Audit Server is not accepting audits, or the Cloudera Manager Agent on the Telemetry Publisher host isn't able to send audits because of some network issue. Check the Cloudera Manager Agent logs and Cloudera Audit Server logs for more details. This test can be enabled or disabled using the Navigator Audit Pipeline Health Check Telemetry Publisher monitoring setting.

Short Name: Audit Pipeline Test

Monitoring Period For Audit Failures

Description

The period to review when checking if audits are blocked and not getting processed.

Template Name

`mgmt_navigator_failure_window`

Default Value

>   20

Unit(s)

>   MINUTES

Navigator Audit Failure Thresholds

Description

>   The health test thresholds for failures encountered when monitoring audits within a recent period specified by the mgmt_navigator_failure_window configuration for the role. The value that can be specified for this threshold is the number of bytes of audits data that is left to be sent to audit server.

Template Name

>   `mgmt_navigator_failure_thresholds`

Default Value

>   critical:any, warning:never

Unit(s)

>   BYTES

Navigator Audit Pipeline Health Check

Description

>   Enable test of audit events processing pipeline. This will test if audit events are not getting processed by Audit Server for a role that generates audit.

Template Name

>   `mgmt_navigator_status_check_enabled`

Default Value

>   true

Unit(s)

Telemetry Publisher Data Directory Free Space Monitoring Percentage Thresholds

Description

> The health test thresholds for monitoring of free space on the filesystem that contains this role's Telemetry Publisher Data Directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a Telemetry Publisher Data Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

> `telemetrypublisher_data_directory_free_space_percentage_thresholds`

Default Value

> critical:never, warning:never

Unit(s)

> PERCENT

Telemetry Publisher Unexpected Exits

This Telemetry Publisher health test checks that the Telemetry Publisher has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Telemetry Publisher monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

> The period to review when computing unexpected exits.

Template Name

```
        unexpected_exits_window
```

Default Value

> 5

Unit(s)

> MINUTES

Unexpected Exits Thresholds

Description

> The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

> unexpected_exits_thresholds

Default Value

> critical:any, warning:never

Unit(s)

> no unit

Telemetry Publisher Web Server Status

This health test checks that the role's web server is responding quickly to requests by the Cloudera Manager Agent, and that the Cloudera Manager Agent can collect metrics from the web server. Failure of this health test may indicate a problem with the web server of the Telemetry Publisher, a misconfiguration of the Telemetry Publisher, or a problem with the Cloudera Manager Agent. Consult the Cloudera Manager Agent logs and the logs of the Telemetry Publisher for more detail. If the test failure message indicates a communication problem, the Cloudera Manager Agent's HTTP requests to the Telemetry Publisher's web server are failing or timing out. If the test's failure message indicates an unexpected response, the Telemetry Publisher's web server responded to the Cloudera Manager Agent's request, but the response could not be interpreted for some reason. This test can be configured using the Web Metric Collection Telemetry Publisher monitoring setting.

Short Name: Web Server Status

Web Metric Collection

Description

> Enables the health test that the Cloudera Manager Agent can successfully contact and gather metrics from the web server.

Template Name

YARN Health Tests

YARN Container Usage Aggregation

This health test checks whether Cloudera Manager can successfully aggregate YARN container usage metrics by reading them from HDFS and running a MapReduce job to aggregate them and store them in Service Monitor storage. A failure of this health test indicates that Cloudera Manager cannot generate cluster usage metrics for YARN jobs. If this test fails, look at Service Monitor logs for more details. This test can be enabled or disabled using the Enable Container Usage Metrics Collection YARN monitoring setting. .

Short Name: YARN Container Usage Aggregation

Enable Container Usage Metrics Collection

Description

Enables storing YARN container usage metrics in HDFS and periodically running a MapReduce job from Cloudera Service Monitor to aggregate them into per-application metrics. This is required for YARN usage reporting to work.

Template Name

> `cm_yarn_enable_container_usage_aggregation`

Default Value

> CDH=[[CDH 5.7.0..CDH 8.0.0)=false]

Unit(s)

> no unit

YARN JobHistory Server Health

This YARN service-level health test checks for the presence of a running, healthy JobHistory Server. The test returns "Bad" health if the service is running and the JobHistory Server is not running. In all other cases it returns the health of the JobHistory Server. A failure of this health test indicates a stopped or unhealthy JobHistory Server. Check the status of the JobHistory Server for more information. This test can be enabled or disabled using the JobHistory Server Role Health Test JobHistory Server service-wide monitoring setting.

Short Name: JobHistory Server Health

JobHistory Server Role Health Test

Description

> When computing the overall YARN health, consider JobHistory Server's health

Template Name

> `yarn_jobhistoryserver_health_enabled`

Default Value

> true

Unit(s)

> no unit

YARN NodeManager Health

This is a YARN service-level health test that checks that enough of the NodeManagers in the cluster are healthy. The test returns "Concerning" health if the number of healthy NodeManagers falls below a warning threshold, expressed as a percentage of the total number of NodeManagers. The test returns "Bad" health if the number of healthy and "Concerning" NodeManagers falls below a critical threshold, expressed as a percentage of the total number of NodeManagers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 NodeManagers, this test would return "Good" health if 95 or more NodeManagers have good health. This test would return "Concerning" health if at least 90 NodeManagers have either "Good" or "Concerning" health. If more than 10 NodeManagers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy NodeManagers. Check the status of the individual NodeManagers for more information. This test can be configured using the YARN YARN service-wide monitoring setting.

Short Name: NodeManager Health

Healthy NodeManager Monitoring Thresholds

Description

> The health test thresholds of the overall NodeManager health. The check returns "Concerning" health if the percentage of "Healthy" NodeManagers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" NodeManagers falls below the critical threshold.

Template Name

> `yarn_nodemanagers_healthy_thresholds`

Default Value

critical:90.0, warning:95.0

Unit(s)

PERCENT

YARN ResourceManager Health (HA)

This is a YARN service-level health test that checks for and active, healthy ResourceManager. The test returns "Bad" health if the service is running and an active ResourceManager cannot be found. If an active ResourceManager is found, then the test checks the health of that ResourceManager as well as the health of any standby ResourceManager configured. A "Good" health result will only be returned if both the active and Standby ResourceManagers are healthy. A failure of this health test may indicate stopped or unhealthy ResourceManager roles, or it may indicate a problem with communication between the Cloudera Manager Service Monitor and the ResourceManagers. Check the status of the YARN service's ResourceManager roles and look in the Cloudera Manager Service Monitor's log files for more information when this test fails. This test can be enabled or disabled using the Active ResourceManager Role Health Check YARN service-wide monitoring setting. The check for a healthy standby ResourceManager can be enabled or disabled with Standby ResourceManager Health Check. In addition, the Active ResourceManager Detection Window can be used to adjust the amount of time that the Cloudera Manager Service Monitor has to detect the active ResourceManager before this health test fails, and the ResourceManager Activation Startup Tolerance can be used to adjust the amount of time around ResourceManager startup that the test allows for a ResourceManager to be made active.

Short Name: ResourceManager Health

Active ResourceManager Detection Window
Description

The tolerance window used in YARN service tests that depend on detection of the active ResourceManager.

Template Name

yarn_active_resourcemanager_detection_window

Default Value

CDH=[[CDH 5.0.0..CDH 8.0.0)=3]

Unit(s)

MINUTES

Active ResourceManager Role Health Check
Description

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

`process_swap_memory_rate_window`

Default Value

5

Unit(s)

MINUTES

YARN Queue Manager Store Unexpected Exits

This YARN Queue Manager Store health test checks that the YARN Queue Manager Store has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period YARN Queue Manager Store monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

`unexpected_exits_window`

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

ZooKeeper Health Tests

ZooKeeper Canary

This is a ZooKeeper service-level health test that checks that basic client operations are working and are completing in a reasonable amount of time. This test reports the results of a periodic "canary" test that performs the following sequence of operations. First, it connects to and establishes a session (the root session) with the ZooKeeper service and creates a permanent znode to serve as the root of all canary operations. The canary test then connects to and establishes sessions (the child sessions) with each ZooKeeper server of the service.. Each child session is used to create an ephemeral child znode under the canary root. After the child znodes have been created, watches that await znode deletion events are registered with each of the child znodes for each of the child sessions. The canary test then deletes each of the child znodes and then verifies that each child session has received deletion notifications for each of the child znodes. Finally the canary test closes all the child sessions, deletes the root znode and closes the root session. The test returns "Bad" health if the establishment of the root session to the ZooKeeper service fails, the creation of znodes (permanent or ephemeral) fails, the deletion of znodes fails or the retrieval of child znodes of the root znode fails. The test returns "Concerning" health when the canary test succeeds but has one or more servers that could not participate in the canary test operations or if the canary test runs too slowly. A failure of this health test may indicate that ZooKeeper is failing to satisfy client requests correctly or in a timely fashion. Check the status of the ZooKeeper servers, and look in the ZooKeeper server logs for more details. This test can be enabled or disabled using

the ZooKeeper Canary Health Check ZooKeeper service monitoring setting. The ZooKeeper Canary Root Znode Path, ZooKeeper Canary Connection Timeout, ZooKeeper Canary Session Timeout, ZooKeeper Canary Operation Timeout settings control the operation of the canary.

Short Name: ZooKeeper Canary

ZooKeeper Canary Connection Timeout

Description

Configures the timeout used by the canary for connection establishment with ZooKeeper servers

ZooKeeper Server Health

This is a ZooKeeper service-level health test that checks that enough of the Servers in the cluster are healthy. The test returns "Concerning" health if the number of healthy Servers falls below a warning threshold, expressed as a percentage of the total number of Servers. The test returns "Bad" health if the number of healthy and "Concerning" Servers falls below a critical threshold, expressed as a percentage of the total number of Servers. For example, if this test is configured with a warning threshold of 95% and a critical threshold of 90% for a cluster of 100 Servers, this test would return "Good" health if 95 or more Servers have good health. This test would return "Concerning" health if at least 90 Servers have either "Good" or "Concerning" health. If more than 10 Servers have bad health, this test would return "Bad" health. A failure of this health test indicates unhealthy Servers. Check the status of the individual Servers for more information. This test can be configured using the ZooKeeper ZooKeeper service-wide monitoring setting.

Short Name: Server Health

Healthy Server Monitoring Thresholds

Description

The health test thresholds of the overall Server health. The check returns "Concerning" health if the percentage of "Healthy" Servers falls below the warning threshold. The check is unhealthy if the total percentage of "Healthy" and "Concerning" Servers falls below the critical threshold.

Template Name

`zookeeper_servers_healthy_thresholds`

ZooKeeper Server Maximum Request Latency

This is a ZooKeeper server health test that checks that the ratio of the maximum request latency to the maximum client-negotiable session timeout does not exceed some value. Note that the maximum client-negotiable timeout need not be the actual session timeout used by a client but is the upper bound of such client session timeouts. As a result, this test being in "Good" health does not preclude clients from experiencing timeouts based on the particular session timeout value they have negotiated with the server. A failure of this health test likely indicates a high load on the ZooKeeper Server. This test can be configured using the Maximum Latency Monitoring Thresholds ZooKeeper Server monitoring setting.

Short Name: Maximum Request Latency

Maximum Latency Monitoring Thresholds

Description

The percentage thresholds of the ratio of the maximum request latency to the maximum client-negotiable session timeout since the server was started.

Template Name

zookeeper_server_max_latency_thresholds

Default Value

critical:100.0, warning:75.0

Unit(s)

PERCENT

ZooKeeper Server Outstanding Requests

This is a ZooKeeper Server role-level health test that checks that a moving average of the size of the ZooKeeper Server's outstanding requests does not exceed some value. Outstanding requests are the number of queued requests in the server. It increases when the server is under load and is receiving more sustained requests than it can process. A failure of this health test indicates a high connection load on the ZooKeeper Server. This test can be configured using the ZooKeeper Server Outstanding Requests Thresholds and ZooKeeper Server Outstanding Requests Monitoring Period ZooKeeper Server monitoring settings.

Short Name: Outstanding Requests

ZooKeeper Server Outstanding Requests Monitoring Period
Description

The period to review when computing the moving average of the outstanding requests queue size. Specified in minutes.

Template Name

zookeeper_server_outstanding_requests_window

Default Value

3

Unit(s)

MINUTES

ZooKeeper Server Outstanding Requests Thresholds
Description

The health check thresholds of the weighted average size of the ZooKeeper Server outstanding requests queue over a recent period. See ZooKeeper Server Outstanding Requests Monitoring Period.

Template Name

zookeeper_server_outstanding_requests_thresholds

Default Value

critical:never, warning:never

Unit(s)

no unit

ZooKeeper Server Process Status

This Server health test checks that the Cloudera Manager Agent on the Server host is heart beating correctly and that the process associated with the Server role is in the state expected by Cloudera Manager. A failure of this health test may indicate a problem with the Server process, a lack of connectivity to the Cloudera Manager Agent on the Server host, or a problem with the Cloudera Manager Agent. This test can fail either because the Server has crashed or because the Server will not start or stop in a timely fashion. Check the Server logs for more details. If the test fails because of problems communicating with the Cloudera Manager Agent on the Server host, check the status of the Cloudera Manager Agent by running /etc/init.d/cloudera-scm-agent status on the Server host, or look in the Cloudera Manager Agent logs on the Server host for more details. This test can be enabled or disabled using the Server Process Health Test Server monitoring setting.

Short Name: Process Status

Server Process Health Test

Description

Enables the health test that the Server's process state is consistent with the role configuration

Template Name

`zookeeper_server_scm_health_enabled`

Default Value

true

Unit(s)

no unit

ZooKeeper Server Quorum Membership

This is a ZooKeeper server role-level health test to verify that the server is part of a quorum. This check is disabled if the ZooKeeper Server is in standalone mode. The test returns "Concerning" health as long as the quorum membership status for the ZooKeeper Server was determined within the detection window and it is in leader election. The test returns "Bad" health if the ZooKeeper Server is not part of a quorum or the quorum status of the ZooKeeper Server could not be determined for the entire detection window. A failure of this health test may indicate a communication problem between this ZooKeeper Server and the rest of its peers or between the Cloudera Manager Service Monitor and the ZooKeeper Server. Check the ZooKeeper Server and Cloudera Manager Service Monitor logs for additional information. This test can be enabled or disabled using the Enable the Quorum Membership Check ZooKeeper Server monitoring setting. In addition, the Quorum Membership Detection Window setting can be used to adjust the time that the Cloudera Manager Service Monitor has to detect the ZooKeeper Server quorum membership status before this health test fails.

Short Name: Quorum Membership

Enable the Quorum Membership Check

Description

Enables the quorum membership check for this ZooKeeper Server.

Template Name

`zookeeper_server_quorum_membership_enabled`

Default Value

true

Unit(s)

no unit

Quorum Membership Detection Window

Description

The tolerance window that will be used in the detection of a ZooKeeper server's membership in a quorum. Specified in minutes.

Template Name

`zookeeper_server_quorum_membership_detection_window`

Default Value

3

Unit(s)

MINUTES

ZooKeeper Server Swap Memory Usage

This Server health test checks the amount of swap memory in use by the role. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Process Swap Memory Thresholds monitoring settings.

Short Name: Swap Memory Usage

Process Swap Memory Thresholds

Description

The health test thresholds on the swap memory usage of the process. This takes precedence over the host level threshold.

Template Name

process_swap_memory_thresholds

Default Value

critical:never, warning:200.0

Unit(s)

BYTES

ZooKeeper Server Swap Memory Usage Rate Beta

This Server health test checks the change of the amount of swap memory usage by the role during a predefined period. A failure of this health test may indicate that your machine is overloaded. This test can be configured using the Swap Memory Usage Rate Thresholds and Swap Memory Usage Rate Window monitoring settings.

Short Name: Swap Memory Usage Rate Beta

Swap Memory Usage Rate Thresholds

Description

The health test thresholds on the swap memory usage rate of the process. Specified as the change of the used swap memory during the predefined period.

Template Name

process_swap_memory_rate_thresholds

Default Value

critical:never, warning:never

Unit(s)

BYTES

Swap Memory Usage Rate Window

Description

The period to review when computing unexpected swap memory usage change of the process.

Template Name

process_swap_memory_rate_window

Default Value

5

Unit(s)

MINUTES

ZooKeeper Server Transaction Log Directory Free Space

This is a Server health test that checks that the filesystem containing the Transaction Log Directory of this Server has sufficient free space. See the Transaction Log Directory description on the Server configuration page for more

information on this directory type. This test can be configured using the Transaction Log Directory Free Space Monitoring Absolute Thresholds and Transaction Log Directory Free Space Monitoring Percentage Thresholds Server monitoring settings.

Short Name: Transaction Log Directory Free Space

Transaction Log Directory Free Space Monitoring Absolute Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's Transaction Log Directory.

Template Name

`zookeeper_server_data_log_directory_free_space_absolute_thresholds`

Default Value

critical:5.36870912E9, warning:1.073741824E10

Unit(s)

BYTES

Transaction Log Directory Free Space Monitoring Percentage Thresholds

Description

The health test thresholds for monitoring of free space on the filesystem that contains this role's Transaction Log Directory. Specified as a percentage of the capacity on that filesystem. This setting is not used if a Transaction Log Directory Free Space Monitoring Absolute Thresholds setting is configured.

Template Name

`zookeeper_server_data_log_directory_free_space_percentage_thresholds`

Default Value

critical:never, warning:never

Unit(s)

PERCENT

ZooKeeper Server Unexpected Exits

This Server health test checks that the Server has not recently exited unexpectedly. The test returns "Bad" health if the number of unexpected exits exceeds a critical threshold. For example, if this test is configured with a critical threshold of 1, this test returns "Good" health if there have been no unexpected exits recently. If 1 or more unexpected exits occured recently, this test returns "Bad" health. The test also indicates whether any of the exits were caused by an OutOfMemory error if the Cloudera Manager Kill When Out of Memory monitoring setting is enabled. This test can be configured using the Unexpected Exits Thresholds and Unexpected Exits Monitoring Period Server monitoring settings.

Short Name: Unexpected Exits

Unexpected Exits Monitoring Period

Description

The period to review when computing unexpected exits.

Template Name

`unexpected_exits_window`

Default Value

5

Unit(s)

MINUTES

Unexpected Exits Thresholds

Description

The health test thresholds for unexpected exits encountered within a recent period specified by the unexpected_exits_window configuration for the role.

Template Name

unexpected_exits_thresholds

Default Value

critical:any, warning:never

Unit(s)

no unit
