Installation overview

Get started with installing Cloudera Streams Messaging - Kubernetes Operator. Learn about available installation methods, the installation artifacts, and where these artifacts are hosted.

Installing Cloudera Streams Messaging - Kubernetes Operator involves installing Strimzi and Cloudera Surveyor for Apache Kafka. Strimzi enables the deployment and management of Kafka and Kafka Connect clusters on Kubernetes, while Cloudera Surveyor is a UI application designed for monitoring and managing Kafka clusters.

The two components are independent and you can choose to install only Strimzi or only Cloudera Surveyor. Whether you choose to install one or both components depends on your use case and operational objectives. Cloudera recommends installing both.

Strimzi and Cloudera Surveyor can be installed using the following methods:

- **Installing with Helm** – The default installation method that works on any supported Kubernetes environment. Installation involves logging in to the Cloudera Docker registry, creating **Secrets** for registry credentials and licensing, and installing using the helm install command.
- **Installing on Taikun CloudWorks** – If you are on Taikun CloudWorks, use the Taikun CloudWorks UI for installation. Installation involves importing repositories, adding components to catalogs, configuring parameters, and then installing through the UI.
- **Installing from OperatorHub in OpenShift** – If you are on OpenShift, you can install from OperatorHub. Installation involves creating **Secrets** for registry credentials and licensing, then installing through the standard OperatorHub process.

Important: Cloudera Surveyor is not available for installation from OperatorHub. An installation from OperatorHub will only install Strimzi.

Installation artifacts and artifact locations

Cloudera Streams Messaging - Kubernetes Operator ships with various installation artifacts. These artifacts are hosted at two locations, the Cloudera Docker registry and the Cloudera Archive.

Both the Cloudera Docker registry and the Cloudera Archive require Cloudera credentials (username and password) for access. Credentials are provided to you as part of your license and subscription agreement. You can access both the registry and the archive using the same credentials.

Cloudera Docker registry – container.repository.cloudera.com

The Docker registry hosts the Helm chart as well as all Docker images used for installation. This includes Strimzi and Kafka, as well as Cloudera Surveyor artifacts.

Table 1: Strimzi and Kafka artifacts on the Cloudera Docker registry

Artifact	Location	Description
Strimzi Docker image	container.repository.cloudera.com/cloudera/kafka-operator:0.47.0.1.5.0-b123	Docker image used for deploying Strimzi and its components.
Kafka Docker image	container.repository.cloudera.com/cloudera/kafka:0.47.0.1.5.0-b123-kafka-4.0.1.1.5	Docker image used for deploying Kafka and related components.
Strimzi Cluster Operator Helm chart	oci://container.repository.cloudera.com/cloudera-helm/csm-operator/strimzi-kafka-operator:1.5.0-b123	Helm chart used to install the Strimzi Cluster Operator with helm install.

Table 2: Cloudera Surveyor artifacts on the Cloudera Docker registry

Artifact	Location	Description
Cloudera Surveyor server Docker image	container.repository.cloudera.com/cloudera/surveyor:0.1.0.1.5.0-b123	Docker image used for deploying Cloudera Surveyor.
Cloudera Surveyor UI application Docker image	container.repository.cloudera.com/cloudera/surveyor-app:0.1.0.1.5.0-b123	Docker image used for deploying Cloudera Surveyor.
Cloudera Surveyor Helm chart	oci://container.repository.cloudera.com/cloudera-helm/csm-operator/surveyor:1.5.0-b123	Helm chart used to install Cloudera Surveyor with helm-install.

Note: The images are built for linux/arm64 and linux/amd64 architectures.

Cloudera Archive – archive.cloudera.com/p/csm-operator/

The Cloudera Archive hosts various installation artifacts including Helm charts, configuration examples, a YAML file containing all CRDs, diagnostic tools, and the maven artifacts.

Accessing the Cloudera Archive and the artifacts it hosts is not necessary to complete installation. All artifacts on the archive are supplemental resources. The following table collects the Cloudera Streams Messaging - Kubernetes Operator directories located in the archive with an overview of what artifacts they contain and how you can use them.

Table 3: Cloudera Streams Messaging - Kubernetes Operator directories on the Cloudera Archive

Archive Directory	Description
https://archive.cloudera.com/p/csm-operator/1.5/charts/	The charts directory contains the Helm charts for both Strimzi and Cloudera Surveyor. These are the same charts that are available on the Docker registry. Cloudera recommends that whenever possible you install with the charts hosted on the registry. The charts on the archive are provided in case you cannot access the registry or want to download the chart using a browser.
https://archive.cloudera.com/p/csm-operator/1.5/examples/	The examples directory includes various examples of resource configuration files. You can use these to quickly deploy Kafka and other components in Kubernetes following installation.
https://archive.cloudera.com/p/csm-operator/1.5/install/	The install directory contains a single YAML file that collects all Strimzi Cluster Operator CRDs. The purpose of this file is twofold. One, the CRDs are rich in comments. Reviewing them can help you better understand how Kafka is deployed and managed with Strimzi in Cloudera Streams Messaging - Kubernetes Operator. It is a supplemental resource to the documentation. Two, this file is used to upgrade CRDs during upgrades. The CRDs are also included in the Strimzi Cluster Operator Helm chart, and Helm will automatically install the necessary CRDs to Kubernetes. You do not need to install them separately with the file hosted on the archive.
https://archive.cloudera.com/p/csm-operator/1.5/maven-repository/	The maven artifacts can be used to develop your own applications or tools for use with Cloudera Streams Messaging - Kubernetes Operator.

Archive Directory	Description
https://archive.cloudera.com/p/csm-operator/1.5/tools/	The tools directory contains command line tools that you use to collect diagnostic information and to troubleshoot cluster issues.

Installing Strimzi with Helm

Learn how to install Strimzi in Cloudera Streams Messaging - Kubernetes Operator with Helm. Installing Strimzi installs the applications and resources that enable you to deploy and manage Kafka in Kubernetes.

Strimzi is installed in your Kubernetes cluster with the Strimzi Cluster Operator Helm chart using the `helm install` command. When you install the chart, Helm installs the Strimzi Custom Resource Definitions (CRDs) included in Cloudera Streams Messaging - Kubernetes Operator and deploys the Strimzi Cluster Operator, which is an operator application that manages and monitors Kafka and related components. Additionally, other cluster resources and applications required for managing Kafka are also installed.

Installing Strimzi does not create or deploy a Kafka cluster. Kafka clusters are created following the installation by deploying `Kafka` and `KafkaNodePool` resources in the Kubernetes cluster with `kubectl` or `oc`.

Cloudera recommends that you install Strimzi once per Kubernetes cluster. Some resources are cluster-wide, which can cause issues if Strimzi is installed multiple times on the same cluster.

By default, the Strimzi Cluster Operator (deployed with installation) watches and manages the Kafka clusters that are deployed in the same namespace as the Strimzi Cluster Operator. However, you can configure it to watch any namespace. This allows you to manage multiple Kafka clusters deployed in different namespaces using a single installation.

Installation instructions are provided for the following scenarios.

- **Installing in an internet environment** – Follow these steps to install Strimzi in a Kubernetes cluster with internet access.
- **Installing in an air-gapped environment** – Follow these steps to install Strimzi in a Kubernetes cluster without internet access or if you want to install from a self-hosted registry.

Installing Strimzi in an internet environment

Complete these steps to install Strimzi if your Kubernetes cluster has internet access.

Before you begin

- Your Kubernetes environment meets requirements listed in [System requirements](#).
- Your Kubernetes cluster requires internet connectivity to complete these steps. It must be able to reach the Cloudera Docker registry.
- You have access to your Cloudera credentials (username and password). Credentials are required to access the Cloudera Archive and Cloudera Docker registry where installation artifacts are hosted.
- You have access to a valid Cloudera license.
- Review the [Helm chart reference](#) before installation.

The Helm chart accepts various configuration properties that you can set during installation. Using these properties you can customize your installation.

- If you are planning to watch and manage more than 20 Kafka clusters with a single installation, you must increase the memory and heap allocated to the Strimzi Cluster Operator. You can specify memory configuration in your `helm install` command. For more information, see [Increasing Cluster Operator memory](#).

Procedure

1. Create a namespace in your Kubernetes cluster.

```
kubectl create namespace [***NAMESPACE***]
```

This is the namespace where you install Strimzi. Use the namespace you create in all installation steps that follow.

2. Log in to the Cloudera Docker registry with helm.

```
helm registry login container.repository.cloudera.com
```

Enter your Cloudera credentials when prompted.

3. Create a Kubernetes Secret containing your Cloudera credentials.

```
kubectl create secret docker-registry [***REGISTRY CREDENTIALS SECRET***] \
  --namespace [***NAMESPACE***] \
  --docker-server container.repository.cloudera.com \
  --docker-username [***USERNAME***] \
  --docker-password "$(echo -n 'Enter your Cloudera password: ' >&2; read
-s password; echo >&2; echo $password)"
```

- Take note of the name you specify as `[***REGISTRY CREDENTIALS SECRET***]`. You will need to specify the name in a later step.
- Replace `[***USERNAME***]` with your Cloudera username.
- Enter your Cloudera password when prompted.

Important: The Secret containing your credentials must exist in the namespace where you install Strimzi as well as all namespaces where you deploy Kafka or Kafka Connect clusters. Cloudera recommends that you create the Secret in all required namespaces now if you know what namespaces you will be using to deploy Kafka or Kafka Connect.

4. Install Strimzi with helm install.

```
helm install strimzi-cluster-operator \
  --namespace [***NAMESPACE***] \
  --set 'image.imagePullSecrets[0].name=[***REGISTRY CREDENTIALS
SECRET***]' \
  --set-file clouderaLicense.fileContent=[***PATH TO LICENSE FILE***] \
  --set watchAnyNamespace=true \
  oci://container.repository.cloudera.com/cloudera-helm/csm-operator/str
imzi-kafka-operator \
  --version 1.5.0-b123
```

- The string `strimzi-cluster-operator` is the Helm release name of the chart installation. This is an arbitrary, user defined name. Cloudera recommends that you use a unique and easily identifiable name.
- `imagePullSecrets` specifies what secret is used to pull images from the Cloudera registry. Setting this property is mandatory, otherwise, Helm cannot pull the necessary images from the Cloudera Docker registry. Ensure that you replace `[***REGISTRY CREDENTIALS SECRET***]` with the name of the secret you created in Step 3 on page 7.
- `clouderaLicense.fileContent` is used to register your license. If this property is set, a secret is generated that contains the license you specify. Setting this property is mandatory. The Strimzi Cluster Operator will not function without a valid license. Ensure that you replace `[***PATH TO LICENSE FILE***]` with the full path to your Cloudera license file.
- You can use `--set` to set various other properties of the Helm chart. This enables you to customize your installation. For example, Cloudera recommends that you configure the Cluster Operator to watch all namespaces, this is configured by setting `watchAnyNamespace` to true. Alternatively, you can configure a list of specific namespaces to watch using `watchNamespaces`.

5. Verify your installation

This is done by listing the deployments and pods in your namespace. If installation is successful, you should see a `strimzi-cluster-operator` deployment and pod present in the cluster.

```
kubectl get deployments --namespace [***NAMESPACE***]
```

NAME	READY	UP - TO - DATE	AVAILABLE	AGE
#...				
strimzi-cluster-operator	1/1	1	1	13m

```
kubectl get pods --namespace [***NAMESPACE***]
```

NAME	READY	UP - TO - DATE	AVAILABLE	AGE
#...				
strimzi-cluster-operator	1/1	1	1	13m

6. Access supplemental resources available on the Cloudera Archive.

Supplemental resources available on the Cloudera Archive include various example files, diagnostic tools, and more. You can use these resources to quickly deploy Kafka clusters and to gain a better understanding of Strimzi and Cloudera Streams Messaging - Kubernetes Operator.

What to do next

- Deploy a Kafka cluster, see [Deploying Kafka](#).
- Set up Prometheus for monitoring, see [Configuring Kafka for Prometheus monitoring](#) and [Monitoring with Prometheus](#).

Related Information

[Cloudera Archive](#)

Installing Strimzi in an air-gapped environment

Complete these steps to install Strimzi if your Kubernetes cluster does not have internet access or if you want to install from a self-hosted registry.

Before you begin

- Your Kubernetes environment meets requirements listed in [System requirements](#).
- A self-hosted Docker registry is required. Your registry must be accessible by your Kubernetes cluster.
- A machine with Internet connectivity is required. While the Kubernetes cluster does not need internet access, you will need a machine to pull the images from the Cloudera Docker registry.
- Access to docker or equivalent utility that you can use to pull and push images is required. The following steps use docker. Replace commands where necessary.
- You have access to your Cloudera credentials (username and password). Credentials are required to access the Cloudera Archive and Cloudera Docker registry where installation artifacts are hosted.
- You have access to a valid Cloudera license.
- Review the [Helm chart reference](#) before installation.

The Helm chart accepts various configuration properties that you can set during installation. Using these properties you can customize your installation.

- If you are planning to watch and manage more than 20 Kafka clusters with a single installation, you must increase the memory and heap allocated to the Strimzi Cluster Operator. You can specify memory configuration in your helm install command. For more information, see [Increasing Cluster Operator memory](#).

Procedure

1. Copy the following installation artifacts to your self-hosted registry.

Table 4: Strimzi and Kafka artifacts on the Cloudera Docker registry

Artifact	Location	Description
Strimzi Docker image	container.repository.cloudera.com/cloudera/kafka-operator:0.47.0.1.5.0-b123	Docker image used for deploying Strimzi and its components.
Kafka Docker image	container.repository.cloudera.com/cloudera/kafka:0.47.0.1.5.0-b123-kafka-4.0.1.1.5	Docker image used for deploying Kafka and related components.
Strimzi Cluster Operator Helm chart	oci://container.repository.cloudera.com/cloudera-helm/csm-operator/strimzi-kafka-operator:1.5.0-b123	Helm chart used to install the Strimzi Cluster Operator with helm install.

Note: The images are built for linux/arm64 and linux/amd64 architectures.

This step involves pulling the artifacts from the Cloudera Docker registry, retagging them, and then pushing them to your self-hosted registry. The exact steps you need to carry it out depend on your environment and how your registry is set up. The following substeps demonstrate the basic workflow using docker and helm.

Tip: If your registry uses a non-default port, you might need to specify the registry port in helm as well as docker commands.

- a) Log in to the Cloudera Docker registry with both docker and helm.

Provide your Cloudera credentials when prompted.

```
docker login container.repository.cloudera.com
```

```
helm registry login container.repository.cloudera.com
```

- b) Pull the Docker images from the Cloudera Docker registry.

```
docker pull \
  --platform [***PLATFORM/ARCHITECTURE***] \
  container.repository.cloudera.com/cloudera/[***IMAGE
NAME***]:[***VERSION***]
```

- c) Pull the Strimzi Cluster Operator Helm chart.

```
helm pull \
  oci://container.repository.cloudera.com/cloudera-helm/csm-operator/str
imzi-kafka-operator \
  --version 1.5.0-b123
```

- d) Retag the Docker images you pulled so that they contain the address of your registry.

```
docker tag \
  [***ORIGINAL IMAGE TAG***] \
  [***YOUR REGISTRY***]/cloudera/[***IMAGE NAME***]:[***VERSION***]
```

- e) Push the images and chart to your self-hosted registry.

```
docker push \
  [***YOUR REGISTRY***]/cloudera/[***IMAGE NAME***]:[***VERSION***]
```

```
helm push \
  strimzi-kafka-operator-1.5.0-b123.tgz \
```

```
oci://[***YOUR_REGISTRY**]/cloudera-helm/csm-operator/
```

2. Create a namespace in your Kubernetes cluster.

```
kubectl create namespace [***NAMESPACE***]
```

This is the namespace where you install Strimzi. Use the namespace you create in all installation steps that follow.

3. Log in to your self-hosted registry with helm.

```
helm registry login [***YOUR_REGISTRY***]
```

Enter your credentials when prompted.

4. Create a Kubernetes Secret containing credentials for your self-hosted registry.

```
kubectl create secret docker-registry [***REGISTRY_CREDENTIALS_SECRET***] \
  --namespace [***NAMESPACE***] \
  --docker-server [***YOUR_REGISTRY***] \
  --docker-username [***USERNAME***] \
  --docker-password "$(echo -n 'Enter your password: ' >&2; read -s password; echo >&2; echo $password)"
```

- Take note of the name you specify as `[***REGISTRY_CREDENTIALS_SECRET***]`. You will need to specify the name in a later step.
- Replace `[***USERNAME***]` with a username valid for your self-hosted registry.
- Enter the password for the user when prompted.

Important: The Secret containing your credentials must exist in the namespace where you install Strimzi as well as all namespaces where you deploy Kafka or Kafka Connect clusters. Cloudera recommends that you create the Secret in all required namespaces now if you know what namespaces you will be using to deploy Kafka or Kafka Connect.

5. Install Strimzi with helm install.

```
helm install strimzi-cluster-operator \
  --namespace [***NAMESPACE***] \
  --set 'image.imagePullSecrets[0].name=[***REGISTRY_CREDENTIALS_SECRET***]' \
  --set defaultImageRegistry=[***YOUR_REGISTRY***] \
  --set-file clouderaLicense.fileContent=[***PATH TO LICENSE FILE***] \
  oci://[***YOUR_REGISTRY***]/cloudera-helm/csm-operator/strimzi-kafka-operator \
  --version 1.5.0-b123 \
  --set watchAnyNamespace=true
```

- The string `strimzi-cluster-operator` is the Helm release name of the chart installation. This is an arbitrary, user defined name. Cloudera recommends that you use a unique and easily identifiable name.
- `imagePullSecrets` specifies what secret is used to pull images from the specified registry. Ensure that you replace `[***REGISTRY_CREDENTIALS_SECRET***]` with the name of the secret you created in Step 4 on page 10.
- `clouderaLicense.fileContent` is used to register your license. If this property is set, a secret is generated that contains the license you specify. Setting this property is mandatory. The Strimzi Cluster Operator will not function without a valid license. Ensure that you replace `[***PATH TO LICENSE FILE***]` with the full path to your Cloudera license file.
- You can use `--set` to set various other properties of the Helm chart. This enables you to customize your installation. For example, Cloudera recommends that you configure the Cluster Operator to watch all namespaces, this is configured by setting `watchAnyNamespace` to true. Alternatively, you can configure a list of specific namespaces to watch using `watchNamespaces`.

6. Verify your installation

This is done by listing the deployments and pods in your namespace. If installation is successful, you should see a `strimzi-cluster-operator` deployment and pod present in the cluster.

```
kubectl get deployments --namespace [***NAMESPACE***]
```

NAME	READY	UP - TO - DATE	AVAILABLE	AGE
#...				
strimzi-cluster-operator	1/1	1	1	13m

```
kubectl get pods --namespace [***NAMESPACE***]
```

NAME	READY	UP - TO - DATE	AVAILABLE	AGE
#...				
strimzi-cluster-operator	1/1	1	1	13m

7. Access supplemental resources available on the Cloudera Archive.

Supplemental resources available on the Cloudera Archive include various example files, diagnostic tools, and more. You can use these resources to quickly deploy Kafka clusters and to gain a better understanding of Strimzi and Cloudera Streams Messaging - Kubernetes Operator.

What to do next

- Deploy a Kafka cluster, see [Deploying Kafka](#).
- Set up Prometheus for monitoring, see [Configuring Kafka for Prometheus monitoring](#) and [Monitoring with Prometheus](#).

[Cloudera Archive](#)

Installing Cloudera Surveyor for Apache Kafka with Helm

Learn how to install Cloudera Surveyor in Cloudera Streams Messaging - Kubernetes Operator with Helm. Cloudera Surveyor is a UI application that enables you to manage and monitor Kafka clusters.

Cloudera Surveyor is installed in your Kubernetes cluster with the Cloudera Surveyor Helm chart using the `helm install` command. When you install the chart, Helm deploys an instance of Cloudera Surveyor, which enables you to manage and monitor your Kafka clusters through a UI interface.

During installation, you configure Cloudera Surveyor using a custom values file (`values.yaml`) passed to the Helm chart with the `--values (-f)` option. This file contains properties for configuring Cloudera Surveyor itself as well as Kafka cluster-specific settings that define which Kafka clusters Cloudera Surveyor connects to. Additionally, some properties are configured with `--set` options.

Installation instructions are provided for the following scenarios.

- **Installing in an internet environment** – Follow these steps to install a fully secure instance of Cloudera Surveyor in a Kubernetes cluster with internet access.
- **Installing in an air-gapped environment** – Follow these steps to install a fully secure instance of Cloudera Surveyor in a Kubernetes cluster without internet access or if you want to install from a self-hosted registry.
- **Installing for evaluation** – Follow these steps to install an unsecure instance of Cloudera Surveyor for development or proof of concept purposes.

Installing Cloudera Surveyor in an internet environment

Complete these steps to install Cloudera Surveyor if your Kubernetes cluster has internet access. These steps install a fully secure instance of Cloudera Surveyor that has authentication, authorization, and channel encryption configured. The example configuration also demonstrates how you can connect a secure Kafka cluster to Cloudera Surveyor.

Before you begin

- General prerequisites:
 - Your Kubernetes environment meets requirements listed in [System requirements](#).
 - Your Kubernetes cluster requires internet connectivity to complete these steps. It must be able to reach the Cloudera Docker registry.
 - You have access to your Cloudera credentials (username and password). Credentials are required to access the Cloudera Archive and Cloudera Docker registry where installation artifacts are hosted.
 - You have access to a valid Cloudera license.
 - Review the [Helm chart reference](#) before installation.

The Helm chart accepts various configuration properties that you can set during installation. Using these properties you can customize your installation.
- Prerequisites for channel encryption (TLS):
 - An Ingress controller is installed in your Kubernetes cluster. These steps use the [Ingress-Nginx controller](#).
 - Optional: cert-manager is installed in your Kubernetes cluster.
- Prerequisites for LDAP authentication:
 - An LDAP server is available that has TLS enabled.
 - The server is accessible from the Kubernetes cluster where Cloudera Surveyor is deployed.
 - Entries containing usernames and passwords are located under a common base in the directory information tree. Passwords must be stored in the userPassword attribute in the user entries.
- Prerequisites for authorization:
 - Ensure that Kafka ACLs are set up for your Kafka cluster. Cloudera Surveyor uses Kafka ACLs to provide authorization.

Procedure

1. Create a namespace in your Kubernetes cluster.

```
kubectl create namespace [***NAMESPACE***]
```

This is the namespace where you install Cloudera Surveyor. Use the namespace you create in all installation steps that follow.

2. Log in to the Cloudera Docker registry with helm.

```
helm registry login container.repository.cloudera.com
```

Enter your Cloudera credentials when prompted.

3. Create a Kubernetes **Secret** containing your Cloudera credentials.

```
kubectl create secret docker-registry [***REGISTRY CREDENTIALS SECRET***] \
  --namespace [***NAMESPACE***] \
  --docker-server container.repository.cloudera.com \
  --docker-username [***USERNAME***] \
```

```
--docker-password "$(echo -n 'Enter your Cloudera password: ' >&2; read
-s password; echo >&2; echo $password)"
```

- Take note of the name you specify as `***REGISTRY CREDENTIALS SECRET***`. You will need to specify the name in a later step.
- Replace `***USERNAME***` with your Cloudera username.
- Enter your Cloudera password when prompted.

4. Create Secrets for sensitive Kafka client configuration values.

Cloudera Surveyor connects to Kafka clusters as any other Kafka client and requires a client configuration. If the Kafka cluster is secured, the client configuration will include sensitive property values. Cloudera recommends that you store sensitive values in Secrets, mount the Secrets to the Cloudera Surveyor Container, and reference the values in your configuration instead of hard-coding them.

Typically, you need to create two Secrets. One contains the Kafka cluster truststore and password, and the other contains a JAAS configuration. The Kafka truststore must be in JKS or PKCS12 format.

```
kubectl create secret generic [***KAFKA TRUSTSTORE SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-file=[***KAFKA TRUSTSTORE KEY***]=[***PATH TO TRUSTSTORE***] \
  --from-file=[***KAFKA TRUSTSTORE PASSWORD KEY***]=[***PATH TO TRUSTSTORE
  PASSWORD FILE***]
```

```
kubectl create secret generic [***KAFKA SASL.JAAS.CONFIG SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-file=[***KAFKA SASL.JAAS.CONFIG KEY***]=[***PATH TO KAFKA
  SASL.JAAS.CONFIG FILE***]
```

- Take note of the Secret names as well as the key names you configure. You will need to specify them in a later step.
- All key names like `***KAFKA TRUSTSTORE KEY***` or `***KAFKA SASL.JAAS.CONFIG KEY***` are arbitrary.
- `***PATH TO KAFKA SASL.JAAS.CONFIG FILE***` is a path to a file containing JAAS configuration similar to the following example:

```
org.apache.kafka.common.security.plain.PlainLoginModule required usernam
e="MY-USER" password="MY-PASSWORD";
```

The contents of this file are set in a later step as the value of the `sasl.jaas.config` Kafka client property for Cloudera Surveyor internal Kafka clients. Ensure that the format of the configuration is valid for the `sasl.jaas.config` property. That is, its a single line of configuration.

5. Prepare a certificate and private key for Cloudera Surveyor.

- If you have cert-manager available, create a `Certificate` resource. Take note of the Secret name you configure in `spec.secretname` of the `Certificate` resource, you will need to specify it in a later step.
- If you are managing keys manually, create a certificate and private key and save it to a Secret. Take note of the Secret name, you will need to specify it in a later step.

This Secret is referred to as `***SURVEYOR TLS CERT SECRET***` in the following steps.

6. Prepare a certificate and private key for Ingress.

- If you have cert-manager available, the certificate and private key for Ingress are automatically requested by the Ingress. You only need to ensure that you have a valid Issuer available in cert-manager. You specify the name of the Issuer resource in a later step.
- If you are managing keys manually, create a certificate and private key and save it to a Secret. Take note of the Secret name, you will need to specify it in a later step.

This Secret referred to as `***INGRESS TLS CERT SECRET***` in the following steps.

7. Set up resources for LDAP authentication.

a) Generate an authentication key and save it as a file.

The authentication key is a random sequence of at least 32 bytes that is saved to a file. To generate it, use any tool or method that is available to you. Take note of the location and name of the file that you create. You will need to specify the file in a later step.

b) Generate a Java truststore (PKCS12 or JKS) containing the TLS certificate of the root Certificate Authority (CA) of the LDAP certificate chain.

```
keytool -import -trustcacerts -file [***LDAP ROOT CA***] \
  -keystore [***TRUSTSTORE NAME***] \
  -storepass [***TRUSTSTORE PASSWORD***] \
  -storetype PKCS12
```

c) Create a Secret containing the truststore and the truststore password.

```
kubectl create secret generic [***LDAP TRUSTSTORE SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-file=[***TRUSTSTORE SECRET KEY***]=[***TRUSTSTORE NAME***] \
  --from-file=[***TRUSTSTORE PW SECRET KEY***]=[***PATH TO TRUSTSTORE PW
  FILE***]
```

Take note of [***LDAP TRUSTSTORE SECRET***], [***TRUSTSTORE SECRET KEY***], and [***TRUSTSTORE PW SECRET KEY***]. You will need to specify these names in a custom values file you create in a later step.

d) Create a Secret containing your LDAP principal and password (bind credentials).

```
kubectl create secret generic [***LDAP CREDENTIALS SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-literal=principal="$(echo -n 'Enter principal: ' >&2; read -s
  principal; echo >&2; echo $principal)" --from-literal=password="$(echo
  -n 'Enter password: ' >&2; read -s password; echo >&2; echo $password)"
```

- Take note of [***LDAP CREDENTIALS SECRET***]. You will need to specify this name in a custom values file you create in a later step.
- Enter your principal and the password for the principal when prompted. Example principal:

```
cn=admin,dc=openldap-chart,dc=ldap
```

8. Prepare a custom values file (values.yaml).

The values file contains configuration for Cloudera Surveyor. This file specifies the Kafka clusters that Cloudera Surveyor connects to as well as various other configuration properties.

```
clusterConfigs:
  clusters:
    - clusterName: [***CLUSTER NAME***]
      tags:
        - [***TAG1***]
        - [***TAG2***]
      bootstrapServers: [***BOOTSTRAP SERVERS***]
      commonClientConfig:
        security.protocol: "SASL_SSL"
        sasl.mechanism: PLAIN
        ssl.truststore.type: "pkcs12"
        ssl.truststore.location: "/opt/secrets/[***KAFKA TRUSTSTORE
        SECRET***]/[***KAFKA TRUSTSTORE FILE***]"
        ssl.truststore.password: "\\${dir:/opt/secrets/[***KAFKA
        TRUSTSTORE SECRET***]:[***KAFKA TRUSTSTORE PASSWORD FILE***]}"
        sasl.jaas.config: "\\${dir:/opt/secrets/[***KAFKA SASL.JAAS.CONFIG
        SECRET***]:[***KAFKA SASL.JAAS.CONFIG FILE***]}"
```

```

    adminOperationTimeout: PT1M
    authorization:
      enabled: true
secretsToMount:
  - create: false
    secretRef: [***KAFKA TRUSTSTORE SECRET***]
    items:
      - key: [***KAFKA TRUSTSTORE KEY***]
        path: [***KAFKA TRUSTSTORE FILE***]
      - key: [***KAFKA TRUSTSTORE PASSWORD KEY***]
        path: [***KAFKA TRUSTSTORE PASSWORD FILE***]
  - create: false
    secretRef: [***KAFKA SASL.JAAS.CONFIG SECRET***]
    items:
      - key: [***KAFKA SASL.JAAS.CONFIG KEY***]
        path: [***KAFKA SASL.JAAS.CONFIG FILE***]
surveyorConfig:
  surveyor:
    authentication:
      enabled: true
  quarkus:
    security:
      ldap:
        dir-context:
          url: ldaps://openldap-chart.ldap:1390
          principal: ${LDAP_PRINCIPAL}
          password: ${LDAP_PASSWORD}
        identity-mapping:
          rdn-identifier: uid
          search-base-dn: ou=users,dc=openldap-chart,dc=ldap
          attribute-mappings:
            "0":
              from: cn
              filter: (cn={0},ou=users,dc=openldap-chart,dc=ldap)
              filter-base-dn: ou=users,dc=openldap-chart,dc=ldap
env:
  - name: LDAP_PRINCIPAL
    valueFrom:
      secretKeyRef:
        name: [***LDAP CREDENTIALS SECRET***]
        key: principal
  - name: LDAP_PASSWORD
    valueFrom:
      secretKeyRef:
        name: [***LDAP CREDENTIALS SECRET***]
        key: password
tlsConfigs:
  enabled: true
  secretRef: [***SURVEYOR TLS CERT SECRET***]
ingress:
  enabled: true
  protocol: HTTPS
  className: nginx
  rules:
    path: "/"
    host: "MY-DOMAIN.EXAMPLE.COM"
    port: 8443
  tls:
    enabled: true
    secretRef: "[***INGRESS TLS CERT SECRET***]"
globalTruststore:
  secretRef:
    name: [***LDAP TRUSTSTORE SECRET***]
    key: [***TRUSTSTORE SECRET KEY***]

```

```

type: PKCS12
password:
  secretRef:
    name: [***LDAP TRUSTSTORE SECRET***]
    key: [***TRUSTSTORE PW SECRET KEY***]

```

For clusterConfigs

clusterConfigs specifies the Kafka clusters that Cloudera Surveyor connects to. Clusters specified here are the ones that will be available on the UI for monitoring and management. For more information and additional examples, see [Registering Kafka clusters](#).

- clusterConfigs.clusters[*] – An array of Kafka clusters and their configuration. Each entry defines the configuration for a single Kafka cluster.
- clusterConfigs.clusters[*].clustername – The name of the cluster. This name is displayed on the UI.
- clusterConfigs.clusters[*].bootstrapServers – A comma-separated list of the bootstrap servers for the Kafka cluster that Cloudera Surveyor connects to. Specify multiple servers for highly available connections.
- clusterConfigs.clusters[*].tags – User defined tags. Used for organization and filtering.
- clusterConfigs.clusters[*].commonClientConfig – Kafka client configuration properties applied to all clients for this cluster. Must contain upstream Kafka client properties as a map. The exact properties that you specify here depend on the security configuration of the Kafka cluster that you want to connect. This example specifies a Kafka cluster that uses PLAIN authentication with TLS.

Sensitive property values are referenced from `Secrets` instead of being hardcoded. `Secrets` containing sensitive properties are mounted using the `secretsToMount` property. References use Kafka `DirectoryConfigProvider` syntax.

Note: References in the client configurations must be escaped because Cloudera Surveyor itself uses the same syntax for references.

- clusterConfigs.clusters[*].authorization.enabled – Enables or disables authorization for this cluster.

For secretsToMount

secretsToMount specifies the `Secrets` to mount in the Cloudera Surveyor Container. You use `secretsToMount` to mount the sensitive values required for Kafka client configuration specified in `clusterConfigs`. For more information and additional examples, see [Managing sensitive data in client configuration](#)

- secretsToMount[*].create – Specifies whether to create the `Secret`. Set to false in this example as the `Secrets` are assumed to already exist.
- secretsToMount[*].secretRef – The name of the `Secret` to mount.
- secretsToMount[*].items[*].key – The key in the `Secret` to mount.
- secretsToMount[*].items[*].path – The path where the item is mounted. The path is relative to `/opt/secrets/[***SECRET NAME***]/` in the Cloudera Surveyor Container.

For surveyorConfig

surveyorConfig specifies global configuration for Cloudera Surveyor. This example sets various authentication properties.

- surveyorConfig.surveyor.authentication.enabled - Enables or disables authentication. Set to true by default. Included in the example as a reference, you do not need to set the property explicitly to enable authentication.
- surveyorConfig.quarkus.security.ldap.dir-context.* - These properties configure the LDAP server that Cloudera Surveyor connects to. They specify the server URL, the distinguished name (DN) of the bind

user, and the password of the bind user. These are required for establishing a secure connection with the LDAP directory.

The bind user credentials (principal and password) are referenced from the `LDAP_PRINCIPAL` and `LDAP_PASSWORD` environment variables. These environment variables are set using the `env` property. Their contents are referenced from a `Secret` that you created in a previous step.

Important: To ensure that Cloudera Surveyor connects to the LDAP server securely, the URL you specify in `surveyorConfig.quarkus.security.ldap.dir-context.url` must start with `ldaps://`.

- `surveyorConfig.quarkus.security.ldap.identity-mapping.*` - These properties configure how Cloudera Surveyor interacts with the LDAP directory to identify users and map their group memberships. They define the attributes and base DN's used to locate user entries and groups in the directory, as well as the filters applied to verify group membership.

For more information regarding `surveyorConfig.quarkus.*` properties, see [Using Security with an LDAP Realm](#) in the Quarkus documentation.

Note: Groups are not required for authentication. You might want to configure the `surveyorConfig.quarkus.security.ldap.identity-mapping.attribute-mappings.*` properties accordingly.

For `tlsConfigs`

`tlsConfigs` enables TLS and specifies the `Secret` containing the certificate of Cloudera Surveyor.

- `tlsConfigs.enabled` – Enables or disables TLS. Set to `true` by default. Included in the example as a reference, you do not need to set the property explicitly to enable TLS.
- `tlsConfigs.secretRef` – Name of the `Secret` containing the Cloudera Surveyor certificate and key.

For `ingress`

`ingress` enables the creation of an `Ingress`. The `Ingress` provides secure external access to the Cloudera Surveyor UI.

- `ingress.enabled` – Enables or disables `Ingress`.
- `ingress.protocol` – Configures the `Ingress` protocol.
- `ingress.className` – The class name of the `Ingress` controller. This example configures the `Ingress-Nginx` controller.
- `ingress.rules.host` – Specifies the DNS hostname that the `Ingress` controller should match for incoming HTTP/HTTPS requests.
- `ingress.rules.port` – The port of the `Ingress` rule. This is the port of the `Kubernetes Service` that the `Ingress` forwards requests to.
- `ingress.tls.enabled` – Enables TLS for the `Ingress`.
- `ingress.tls.secretRef` – The name of the `Secret` that contains `Ingress` TLS certificates.

Note: If you are using `cert-manager`, configure `ingress.tls.issuer` and set it to the name of your `Issuer` resource. If set, `Ingress` will automatically request a certificate and save it to the `Secret` specified in `ingress.tls.secretRef`.

For `globalTruststore`

`globalTruststore` specifies the `Secrets` containing the truststore of the LDAP server and the password for the truststore.

- `globalTruststore.secretRef.name` – The name of the `Kubernetes Secret` containing the truststore of the LDAP server.
- `globalTruststore.secretRef.key` – The key in the `Kubernetes Secret` that contains the truststore.
- `globalTruststore.password.name` – The name of the `Kubernetes Secret` containing the truststore password.
- `globalTruststore.password.key` – The key in the `Kubernetes Secret` that contains the truststore password.

9. Install Cloudera Surveyor with helm install.

```
helm install cloudera-surveyor \
  --namespace [***NAMESPACE***] \
  --values [***VALUES FILE***] \
  --set-file surveyorConfig.surveyor.authentication.keys.active=[***PATH
TO AUTHENTICATION KEY FILE***] \
  --set 'image.imagePullSecrets=[***REGISTRY CREDENTIALS SECRET***]' \
  --set-file clouderaLicense.fileContent=[***PATH TO LICENSE FILE***] \
  oci://container.repository.cloudera.com/cloudera-helm/csm-operator/surv
eyor \
  --version 1.5.0-b123
```

- The string cloudera-surveyor is the Helm release name of the chart installation. This is an arbitrary, user defined name. Cloudera recommends that you use a unique and easily identifiable name.
- [***VALUES FILE***] is the values file you prepared in Step 8 on page 14.
- surveyorConfig.surveyor.authentication.keys.active specifies the file containing the authentication key that you generated in Step 7 on page 14. The key is required for LDAP authentication to function.
- imagePullSecrets specifies what Secret is used to pull images from the Cloudera registry. Setting this property is mandatory, otherwise, Helm cannot pull the necessary images from the Cloudera Docker registry. Ensure that you replace [***REGISTRY CREDENTIALS SECRET***] with the name of the Secret you created in Step 3 on page 12.
- clouderaLicense.fileContent is used to register your license. If this property is set, a Secret is generated that contains the license you specify. Setting this property is mandatory. Cloudera Surveyor will not function without a valid license. Ensure that you replace [***PATH TO LICENSE FILE***] with the full path to your Cloudera license file.
- You can use --set to override properties that are defined in your values file, or add additional properties that are not present in your values file.

10. Verify your installation.

This is done by listing the Deployments and Pods in your namespace. If installation is successful, a Cloudera Surveyor Deployment and two Pods will be present in the cluster.

```
kubectl get deployments --namespace [***NAMESPACE***]
```

NAME		READY	UP-TO-DATE	AVAILABLE	AGE
#...					
cloudera-surveyor	2/2	2	2	13m	

```
kubectl get pods --namespace [***NAMESPACE***]
```

NAME	READY	STATUS	RESTARTS	AGE
#...				
cloudera-surveyor-649f755f6d-689gx	1/1	Running		0
13m				
cloudera-surveyor-649f755f6d-xj2kp	1/1	Running		0
13m				

11. Access the Cloudera Surveyor UI.

The UI is accessible by connecting to the Ingress.

```
kubectl get ingress cloudera-surveyor-ingress --namespac
e [***NAMESPACE***]
```

NAME	CLASS	HOSTS	ADDRESS
PORTS			

```
cloudera-surveyor-ingress  nginx  my-domain.example.com  10.14.91.1  80,443
```

Typically you will be able to access the UI through the host and port listed. However, the exact port that you have to use might be infrastructure dependent. If you are unable to connect, check the configuration of your Ingress controller. You can also try connecting directly to the Service of the Ingress.

Results

Cloudera Surveyor is installed. You can now manage and monitor your Kafka clusters using the UI.

Installing Cloudera Surveyor in an air-gapped environment

Complete these steps to install Cloudera Surveyor if your Kubernetes cluster does not have internet access or if you want to install from a self-hosted registry. These steps install a fully secure instance of Cloudera Surveyor that has authentication, authorization, and channel encryption configured. The example configuration also demonstrates how you can connect a secure Kafka cluster to Cloudera Surveyor.

Before you begin

- General prerequisites:
 - Your Kubernetes environment meets requirements listed in [System requirements](#).
 - A self-hosted Docker registry is required. Your registry must be accessible by your Kubernetes cluster.
 - A machine with Internet connectivity is required. While the Kubernetes cluster does not need internet access, you will need a machine to pull the images from the Cloudera Docker registry.
 - Access to docker or equivalent utility that you can use to pull and push images is required. The following steps use docker. Replace commands where necessary.
 - You have access to your Cloudera credentials (username and password). Credentials are required to access the Cloudera Archive and Cloudera Docker registry where installation artifacts are hosted.
 - You have access to a valid Cloudera license.
 - Review the [Helm chart reference](#) before installation.

The Helm chart accepts various configuration properties that you can set during installation. Using these properties you can customize your installation.

- Prerequisites for channel encryption (TLS):
 - An Ingress controller is installed in your Kubernetes cluster. These steps use the [Ingress-Nginx controller](#).
 - Optional: cert-manager is installed in your Kubernetes cluster.
- Prerequisites for LDAP authentication:
 - An LDAP server is available that has TLS enabled.
 - The server is accessible from the Kubernetes cluster where Cloudera Surveyor is deployed.
 - Entries containing usernames and passwords are located under a common base in the directory information tree. Passwords must be stored in the userPassword attribute in the user entries.
- Prerequisites for authorization:
 - Ensure that Kafka ACLs are set up for your Kafka cluster. Cloudera Surveyor uses Kafka ACLs to provide authorization.

Procedure

1. Copy the following installation artifacts to your self-hosted registry.

Table 5: Cloudera Surveyor artifacts on the Cloudera Docker registry

Artifact	Location	Description
Cloudera Surveyor server Docker image	container.repository.cloudera.com/cloudera/surveyor:0.1.0.1.5.0-b123	Docker image used for deploying Cloudera Surveyor.
Cloudera Surveyor UI application Docker image	container.repository.cloudera.com/cloudera/surveyor-app:0.1.0.1.5.0-b123	Docker image used for deploying Cloudera Surveyor.
Cloudera Surveyor Helm chart	oci://container.repository.cloudera.com/cloudera-helm/csm-operator/surveyor:1.5.0-b123	Helm chart used to install Cloudera Surveyor with helm-install.

Note: The images are built for linux/arm64 and linux/amd64 architectures.

This step involves pulling the artifacts from the Cloudera Docker registry, retagging them, and then pushing them to your self-hosted registry. The exact steps you need to carry it out depend on your environment and how your registry is set up. The following substeps demonstrate the basic workflow using docker and helm.

Tip: If your registry uses a non-default port, you might need to specify the registry port in helm as well as docker commands.

- a) Log in to the Cloudera Docker registry with both docker and helm.
Provide your Cloudera credentials when prompted.

```
docker login container.repository.cloudera.com
```

```
helm registry login container.repository.cloudera.com
```

- b) Pull the Docker images from the Cloudera Docker registry.

```
docker pull \
  --platform [***PLATFORM/ARCHITECTURE***] \
  container.repository.cloudera.com/cloudera/[***IMAGE
  NAME***]:[***VERSION***]
```

- c) Pull the Cloudera Surveyor Helm chart.

```
helm pull \
  oci://container.repository.cloudera.com/cloudera-helm/csm-operator/sur
  veyor \
  --version 1.5.0-b123
```

- d) Retag the Docker images you pulled so that they contain the address of your registry.

```
docker tag \
  [***ORIGINAL IMAGE TAG***] \
  [***YOUR REGISTRY***]/cloudera/[***IMAGE NAME***]:[***VERSION***]
```

- e) Push the images and chart to your self-hosted registry.

```
docker push \
  [***YOUR REGISTRY***]/cloudera/[***IMAGE NAME***]:[***VERSION***]
```

```
helm push \
  surveyor-1.5.0-b123.tgz \
```

```
oci://[***YOUR_REGISTRY***]/cloudera-helm/csm-operator/surveyor
```

2. Create a namespace in your Kubernetes cluster.

```
kubectl create namespace [***NAMESPACE***]
```

This is the namespace where you install Cloudera Surveyor. Use the namespace you create in all installation steps that follow.

3. Log in to your self-hosted registry with helm.

```
helm registry login [***YOUR_REGISTRY***]
```

Enter your credentials when prompted.

4. Create a Kubernetes Secret containing credentials for your self-hosted registry.

```
kubectl create secret docker-registry [***REGISTRY_CREDENTIALS_SECRET***] \
  --namespace [***NAMESPACE***] \
  --docker-server [***YOUR_REGISTRY***] \
  --docker-username [***USERNAME***] \
  --docker-password "$(echo -n 'Enter your password: ' >&2; read -s password; echo >&2; echo $password)"
```

- Take note of the name you specify as `[***REGISTRY_CREDENTIALS_SECRET***]`. You will need to specify the name in a later step.
- Replace `[***USERNAME***]` with a username valid for your self-hosted registry.
- Enter the password for the user when prompted.

5. Create Secrets for sensitive Kafka client configuration values.

Cloudera Surveyor connects to Kafka clusters as any other Kafka client and requires a client configuration. If the Kafka cluster is secured, the client configuration will include sensitive property values. Cloudera recommends that you store sensitive values in **Secrets**, mount the **Secrets** to the Cloudera Surveyor Container, and reference the values in your configuration instead of hard-coding them.

Typically, you need to create two **Secrets**. One contains the Kafka cluster truststore and password, and the other contains a JAAS configuration. The Kafka truststore must be in JKS or PKCS12 format.

```
kubectl create secret generic [***KAFKA_TRUSTSTORE_SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-file=[***KAFKA_TRUSTSTORE_KEY***]=[***PATH_TO_TRUSTSTORE***] \
  --from-file=[***KAFKA_TRUSTSTORE_PASSWORD_KEY***]=[***PATH_TO_TRUSTSTORE_PASSWORD_FILE***]
```

```
kubectl create secret generic [***KAFKA_SASL.JAAS.CONFIG_SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-file=[***KAFKA_SASL.JAAS.CONFIG_KEY***]=[***PATH_TO_KAFKA_SASL.JAAS.CONFIG_FILE***]
```

- Take note of the **Secret** names as well as the key names you configure. You will need to specify them in a later step.
- All key names like `[***KAFKA_TRUSTSTORE_KEY***]` or `[***KAFKA_SASL.JAAS.CONFIG_KEY***]` are arbitrary.

- `[***PATH TO KAFKA SASL.JAAS.CONFIG FILE***]` is a path to a file containing JAAS configuration similar to the following example:

```
org.apache.kafka.common.security.plain.PlainLoginModule required username="MY-USER" password="MY-PASSWORD";
```

The contents of this file are set in a later step as the value of the `sasl.jaas.config` Kafka client property for Cloudera Surveyor internal Kafka clients. Ensure that the format of the configuration is valid for the `sasl.jaas.config` property. That is, its a single line of configuration.

6. Prepare a certificate and private key for Cloudera Surveyor.

- If you have `cert-manager` available, create a `Certificate` resource. Take note of the `Secret` name you configure in `spec.secretname` of the `Certificate` resource, you will need to specify it in a later step.
- If you are managing keys manually, create a certificate and private key and save it to a `Secret`. Take note of the `Secret` name, you will need to specify it in a later step.

This `Secret` is referred to as `[***SURVEYOR TLS CERT SECRET***]` in the following steps.

7. Prepare a certificate and private key for Ingress.

- If you have `cert-manager` available, the certificate and private key for `Ingress` are automatically requested by the `Ingress`. You only need to ensure that you have a valid `Issuer` available in `cert-manager`. You specify the name of the `Issuer` resource in a later step.
- If you are managing keys manually, create a certificate and private key and save it to a `Secret`. Take note of the `Secret` name, you will need to specify it in a later step.

This `Secret` referred to as `[***INGRESS TLS CERT SECRET***]` in the following steps.

8. Set up resources for LDAP authentication.

a) Generate an authentication key and save it as a file.

The authentication key is a random sequence of at least 32 bytes that is saved to a file. To generate it, use any tool or method that is available to you. Take note of the location and name of the file that you create. You will need to specify the file in a later step.

b) Generate a Java truststore (PKCS12 or JKS) containing the TLS certificate of the root Certificate Authority (CA) of the LDAP certificate chain.

```
keytool -import -trustcacerts -file [***LDAP ROOT CA***] \
  -keystore [***TRUSTSTORE NAME***] \
  -storepass [***TRUSTSTORE PASSWORD***] \
  -storetype PKCS12
```

c) Create a `Secret` containing the truststore and the truststore password.

```
kubectl create secret generic [***LDAP TRUSTSTORE SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-file=[***TRUSTSTORE SECRET KEY***]=[***TRUSTSTORE NAME***] \
  --from-file=[***TRUSTSTORE PW SECRET KEY***]=[***PATH TO TRUSTSTORE PW FILE***]
```

Take note of `[***LDAP TRUSTSTORE SECRET***]`, `[***TRUSTSTORE SECRET KEY***]`, and `[***TRUSTSTORE PW SECRET KEY***]`. You will need to specify these names in a custom values file you create in a later step.

d) Create a `Secret` containing your LDAP principal and password (bind credentials).

```
kubectl create secret generic [***LDAP CREDENTIALS SECRET***] \
  --namespace [***NAMESPACE***] \
```

```
--from-literal=principal="$(echo -n 'Enter principal: ' >&2; read -s
principal; echo >&2; echo $principal)" --from-literal=password="$(echo
-n 'Enter password: ' >&2; read -s password; echo >&2; echo $password)"
```

- Take note of `***LDAP CREDENTIALS SECRET***`. You will need to specify this name in a custom values file you create in a later step.
- Enter your principal and the password for the principal when prompted. Example principal:

```
cn=admin,dc=openldap-chart,dc=ldap
```

9. Prepare a custom values file (values.yaml).

The values file contains configuration for Cloudera Surveyor. This file specifies the Kafka clusters that Cloudera Surveyor connects to as well as various other configuration properties.

```
clusterConfigs:
  clusters:
    - clusterName: [***CLUSTER NAME***]
      tags:
        - [***TAG1***]
        - [***TAG2***]
      bootstrapServers: [***BOOTSTRAP SERVERS***]
      commonClientConfig:
        security.protocol: "SASL_SSL"
        sasl.mechanism: PLAIN
        ssl.truststore.type: "pkcs12"
        ssl.truststore.location: "/opt/secrets/[***KAFKA TRUSTSTORE
SECRET***]/[***KAFKA TRUSTSTORE FILE***]"
        ssl.truststore.password: "\\${dir:/opt/secrets/[***KAFKA
TRUSTSTORE SECRET***]:[***KAFKA TRUSTSTORE PASSWORD FILE***]}"
        sasl.jaas.config: "\\${dir:/opt/secrets/[***KAFKA SASL.JAAS.CONFIG
SECRET***]:[***KAFKA SASL.JAAS.CONFIG FILE***]}"
        adminOperationTimeout: PT1M
      authorization:
        enabled: true
  secretsToMount:
    - create: false
      secretRef: [***KAFKA TRUSTSTORE SECRET***]
      items:
        - key: [***KAFKA TRUSTSTORE KEY***]
          path: [***KAFKA TRUSTSTORE FILE***]
        - key: [***KAFKA TRUSTSTORE PASSWORD KEY***]
          path: [***KAFKA TRUSTSTORE PASSWORD FILE***]
    - create: false
      secretRef: [***KAFKA SASL.JAAS.CONFIG SECRET***]
      items:
        - key: [***KAFKA SASL.JAAS.CONFIG KEY***]
          path: [***KAFKA SASL.JAAS.CONFIG FILE***]
  surveyorConfig:
    surveyor:
      authentication:
        enabled: true
    quarkus:
      security:
        ldap:
          dir-context:
            url: ldaps://openldap-chart.ldap:1390
            principal: ${LDAP_PRINCIPAL}
            password: ${LDAP_PASSWORD}
          identity-mapping:
            rdn-identifier: uid
            search-base-dn: ou=users,dc=openldap-chart,dc=ldap
            attribute-mappings:
```

```

      "0":
        from: cn
        filter: (cn={0},ou=users,dc=openldap-chart,dc=ldap)
        filter-base-dn: ou=users,dc=openldap-chart,dc=ldap
env:
  - name: LDAP_PRINCIPAL
    valueFrom:
      secretKeyRef:
        name: [***LDAP CREDENTIALS SECRET***]
        key: principal
  - name: LDAP_PASSWORD
    valueFrom:
      secretKeyRef:
        name: [***LDAP CREDENTIALS SECRET***]
        key: password
tlsConfigs:
  enabled: true
  secretRef: [***SURVEYOR TLS CERT SECRET***]
ingress:
  enabled: true
  protocol: HTTPS
  className: nginx
  rules:
    path: "/"
    host: "MY-DOMAIN.EXAMPLE.COM"
    port: 8443

    enabled: true
    secretRef: [***INGRESS TLS CERT SECRET***]
globalTruststore:
  secretRef:
    name: [***LDAP TRUSTSTORE SECRET***]
    key: [***TRUSTSTORE SECRET KEY***]
  type: PKCS12
  password:
    secretRef:
      name: [***LDAP TRUSTSTORE SECRET***]
      key: [***TRUSTSTORE PW SECRET KEY***]

```

For clusterConfigs

clusterConfigs specifies the Kafka clusters that Cloudera Surveyor connects to. Clusters specified here are the ones that will be available on the UI for monitoring and management. For more information and additional examples, see [Registering Kafka clusters](#).

- clusterConfigs.clusters[*] – An array of Kafka clusters and their configuration. Each entry defines the configuration for a single Kafka cluster.
- clusterConfigs.clusters[*].clustername – The name of the cluster. This name is displayed on the UI.
- clusterConfigs.clusters[*].bootstrapServers – A comma-separated list of the bootstrap servers for the Kafka cluster that Cloudera Surveyor connects to. Specify multiple servers for highly available connections.
- clusterConfigs.clusters[*].tags – User defined tags. Used for organization and filtering.
- clusterConfigs.clusters[*].commonClientConfig – Kafka client configuration properties applied to all clients for this cluster. Must contain upstream Kafka client properties as a map. The exact properties that

you specify here depend on the security configuration of the Kafka cluster that you want to connect. This example specifies a Kafka cluster that uses PLAIN authentication with TLS.

Sensitive property values are referenced from `Secrets` instead of being hardcoded. `Secrets` containing sensitive properties are mounted using the `secretsToMount` property. References use Kafka `DirectoryConfigProvider` syntax.

Note: References in the client configurations must be escaped because Cloudera Surveyor itself uses the same syntax for references.

- `clusterConfigs.clusters[*].authorization.enabled` – Enables or disables authorization for this cluster.

For `secretsToMount`

`secretsToMount` specifies the `Secrets` to mount in the Cloudera Surveyor Container. You use `secretsToMount` to mount the sensitive values required for Kafka client configuration specified in `clusterConfigs`. For more information and additional examples, see [Managing sensitive data in client configuration](#)

- `secretsToMount[*].create` – Specifies whether to create the `Secret`. Set to `false` in this example as the `Secrets` are assumed to already exist.
- `secretsToMount[*].secretRef` – The name of the `Secret` to mount.
- `secretsToMount[*].items[*].key` – The key in the `Secret` to mount.
- `secretsToMount[*].items[*].path` – The path where the item is mounted. The path is relative to `/opt/secrets/[***SECRET NAME***]/` in the Cloudera Surveyor Container.

For `surveyorConfig`

`surveyorConfig` specifies global configuration for Cloudera Surveyor. This example sets various authentication properties.

- `surveyorConfig.surveyor.authentication.enabled` - Enables or disables authentication. Set to `true` by default. Included in the example as a reference, you do not need to set the property explicitly to enable authentication.
- `surveyorConfig.quarkus.security.ldap.dir-context.*` - These properties configure the LDAP server that Cloudera Surveyor connects to. They specify the server URL, the distinguished name (DN) of the bind user, and the password of the bind user. These are required for establishing a secure connection with the LDAP directory.

The bind user credentials (principal and password) are referenced from the `LDAP_PRINCIPAL` and `LDAP_PASSWORD` environment variables. These environment variables are set using the `env` property. Their contents are referenced from a `Secret` that you created in a previous step.

Important: To ensure that Cloudera Surveyor connects to the LDAP server securely, the URL you specify in `surveyorConfig.quarkus.security.ldap.dir-context.url` must start with `ldaps://`.

- `surveyorConfig.quarkus.security.ldap.identity-mapping.*` - These properties configure how Cloudera Surveyor interacts with the LDAP directory to identify users and map their group memberships. They define the attributes and base DN's used to locate user entries and groups in the directory, as well as the filters applied to verify group membership.

For more information regarding `surveyorConfig.quarkus.*` properties, see [Using Security with an LDAP Realm](#) in the Quarkus documentation.

Note: Groups are not required for authentication. You might want to configure the `surveyorConfig.quarkus.security.ldap.identity-mapping.attribute-mappings.*` properties accordingly.

For `tlsConfigs`

`tlsConfigs` enables TLS and specifies the `Secret` containing the certificate of Cloudera Surveyor.

- `tlsConfigs.enabled` – Enables or disables TLS. Set to `true` by default. Included in the example as a reference, you do not need to set the property explicitly to enable TLS.

- `tlsConfigs.secretRef` – Name of the `Secret` containing the Cloudera Surveyor certificate and key.

For ingress

`ingress` enables the creation of an `Ingress`. The `Ingress` provides secure external access to the Cloudera Surveyor UI.

- `ingress.enabled` – Enables or disables `Ingress`.
- `ingress.protocol` – Configures the `Ingress` protocol.
- `ingress.className` – The class name of the `Ingress` controller. This example configures the `Ingress-Nginx` controller.
- `ingress.rules.host` – Specifies the DNS hostname that the `Ingress` controller should match for incoming HTTP/HTTPS requests.
- `ingress.rules.port` – The port of the `Ingress` rule. This is the port of the `Kubernetes Service` that the `Ingress` forwards requests to.
- `ingress.tls.enabled` – Enables TLS for the `Ingress`.
- `ingress.tls.secretRef` – The name of the `Secret` that contains `Ingress` TLS certificates.

Note: If you are using `cert-manager`, configure `ingress.tls.issuer` and set it to the name of your `Issuer` resource. If set, `Ingress` will automatically request a certificate and save it to the `Secret` specified in `ingress.tls.secretRef`.

For globalTruststore

`globalTruststore` specifies the `Secrets` containing the truststore of the LDAP server and the password for the truststore.

- `globalTruststore.secretRef.name` – The name of the `Kubernetes Secret` containing the truststore of the LDAP server.
- `globalTruststore.secretRef.key` – The key in the `Kubernetes Secret` that contains the truststore.
- `globalTruststore.password.name` – The name of the `Kubernetes Secret` containing the truststore password.
- `globalTruststore.password.key` – The key in the `Kubernetes Secret` that contains the truststore password.

10. Install Cloudera Surveyor with helm `install`.

```
helm install cloudera-surveyor \
  --namespace [***NAMESPACE***] \
  --values [***VALUES FILE***] \
  --set-file surveyorConfig.surveyor.authentication.keys.active=[***PATH
TO AUTHENTICATION KEY FILE***] \
  --set image.registry=[***YOUR REGISTRY***] \
  --set 'image.imagePullSecrets=[***REGISTRY CREDENTIALS SECRET***]' \
  --set-file clouderaLicense.fileContent=[***PATH TO LICENSE FILE***] \
  oci://[***YOUR REGISTRY***]/cloudera-helm/csm-operator/surveyor \
  --version 1.5.0-b123
```

- The string `cloudera-surveyor` is the Helm release name of the chart installation. This is an arbitrary, user defined name. Cloudera recommends that you use a unique and easily identifiable name.
- `[***VALUES FILE***]` is the values file you prepared in Step 9 on page 23.
- `surveyorConfig.surveyor.authentication.keys.active` specifies the file containing the authentication key that you generated in Step 8 on page 22. The key is required for LDAP authentication to function.
- `imagePullSecrets` specifies what `Secret` is used to pull images from the specified registry. Ensure that you replace `[***REGISTRY CREDENTIALS SECRET***]` with the name of the `Secret` you created in Step 4 on page 21.
- `clouderaLicense.fileContent` is used to register your license. If this property is set, a `Secret` is generated that contains the license you specify. Setting this property is mandatory. Cloudera Surveyor will not function

without a valid license. Ensure that you replace `[***PATH TO LICENSE FILE***]` with the full path to your Cloudera license file.

- You can use `--set` to override properties that are defined in your values file, or add additional properties that are not present in your values file.

11. Verify your installation.

This is done by listing the Deployments and Pods in your namespace. If installation is successful, a Cloudera Surveyor Deployment and two Pods will be present in the cluster.

```
kubectl get deployments --namespace [***NAMESPACE***]
```

NAME		READY	UP-TO-DATE	AVAILABLE	AGE
#...					
cloudera-surveyor	2/2	2	2	13m	

```
kubectl get pods --namespace [***NAMESPACE***]
```

NAME	READY	STATUS	RESTARTS	AGE
#...				
cloudera-surveyor-649f755f6d-689gx	1/1	Running		0
13m				
cloudera-surveyor-649f755f6d-xj2kp	1/1	Running		0
13m				

12. Access the Cloudera Surveyor UI.

The UI is accessible by connecting to the Ingress.

```
kubectl get ingress cloudera-surveyor-ingress --namespace [***NAMESPACE***]
```

NAME	CLASS	HOSTS	ADDRESS
PORTS			
cloudera-surveyor-ingress	nginx	my-domain.example.com	10.14.91.1 80, 443

Typically you will be able to access the UI through the host and port listed. However, the exact port that you have to use might be infrastructure dependent. If you are unable to connect, check the configuration of your Ingress controller. You can also try connecting directly to the Service of the Ingress.

Results

Cloudera Surveyor is installed. You can now manage and monitor your Kafka clusters using the UI.

Installing Cloudera Surveyor for evaluation

Complete these steps to install a basic deployment of Cloudera Surveyor that has no security configured. Use these instructions if you want to install quickly in a development environment for proof of concept or evaluation purposes.

Before you begin

- Your Kubernetes environment meets requirements listed in [System requirements](#).
- Your Kubernetes cluster requires internet connectivity to complete these steps. It must be able to reach the Cloudera Docker registry.

- You have access to your Cloudera credentials (username and password). Credentials are required to access the Cloudera Archive and Cloudera Docker registry where installation artifacts are hosted.
- You have access to a valid Cloudera license.
- Review the [Helm chart reference](#) before installation.

The Helm chart accepts various configuration properties that you can set during installation. Using these properties you can customize your installation.

Procedure

1. Create a namespace in your Kubernetes cluster.

```
kubectl create namespace [***NAMESPACE***]
```

This is the namespace where you install Cloudera Surveyor. Use the namespace you create in all installation steps that follow.

2. Log in to the Cloudera Docker registry with helm.

```
helm registry login container.repository.cloudera.com
```

Enter your Cloudera credentials when prompted.

3. Create a Kubernetes Secret containing your Cloudera credentials.

```
kubectl create secret docker-registry [***REGISTRY CREDENTIALS SECRET***] \
  --namespace [***NAMESPACE***] \
  --docker-server container.repository.cloudera.com \
  --docker-username [***USERNAME***] \
  --docker-password "$(echo -n 'Enter your Cloudera password: ' >&2; read \
  -s password; echo >&2; echo $password)"
```

- Take note of the name you specify as `[***REGISTRY CREDENTIALS SECRET***]`. You will need to specify the name in a later step.
 - Replace `[***USERNAME***]` with your Cloudera username.
 - Enter your Cloudera password when prompted.
4. Prepare a custom values file (values.yaml).

The values file contains configuration for Cloudera Surveyor. This file specifies the Kafka clusters that Cloudera Surveyor connects to as well as various other configuration properties.

```
clusterConfigs:
  clusters:
    - clusterName: [***CLUSTER NAME***]
      tags:
        - [***TAG1***]
        - [***TAG2***]
      bootstrapServers: [***BOOTSTRAP SERVERS***]
      adminOperationTimeout: PT1M
      authorization:
        enabled: false
      commonClientConfig:
        security.protocol: PLAINTEXT
  surveyorConfig:
    surveyor:
      authentication:
        enabled: false
  tlsConfigs:
```

```
enabled: false
```

- `clusterConfigs.clusters[*]` – An array of Kafka clusters and their configuration. Each entry defines the configuration for a single Kafka cluster.
- `clusterConfigs.clusters[*].clustername` – The name of the cluster. This name is displayed on the UI.
- `clusterConfigs.clusters[*].bootstrapServers` – A comma-separated list of the bootstrap servers for the Kafka cluster that Cloudera Surveyor connects to. Specify multiple servers for highly available connections.
- `clusterConfigs.clusters[*].commonClientConfig` – Kafka client configuration properties applied to all clients for this cluster. Must contain upstream Kafka client properties as a map. The exact properties that you specify here depend on the security configuration of the Kafka cluster that you want to connect. This example specifies a Kafka cluster that is unsecure. For more information, see *Registering Kafka clusters*.
- All security-related properties are set false to disable security. These properties must be explicitly set to false as the default value for all of them is true.

5. Install Cloudera Surveyor with helm install.

```
helm install cloudera-surveyor \
  --namespace [***NAMESPACE***] \
  --values [***VALUES FILE***] \
  --set 'image.imagePullSecrets=[***REGISTRY CREDENTIALS SECRET***]' \
  --set-file clouderaLicense.fileContent=[***PATH TO LICENSE FILE***] \
  oci://container.repository.cloudera.com/cloudera-helm/csm-operator/surveyor \
  --version 1.5.0-b123
```

- The string `cloudera-surveyor` is the Helm release name of the chart installation. This is an arbitrary, user defined name. Cloudera recommends that you use a unique and easily identifiable name.
- `[***VALUES FILE***]` is the values file you prepared in Step 4 on page 28.
- `imagePullSecrets` specifies what secret is used to pull images from the Cloudera registry. Setting this property is mandatory, otherwise, Helm cannot pull the necessary images from the Cloudera Docker registry. Ensure that you replace `[***REGISTRY CREDENTIALS SECRET***]` with the name of the `Secret` you created in Step 3 on page 28.
- `clouderaLicense.fileContent` is used to register your license. If this property is set, a `Secret` is generated that contains the license you specify. Setting this property is mandatory. Cloudera Surveyor will not function without a valid license. Ensure that you replace `[***PATH TO LICENSE FILE***]` with the full path to your Cloudera license file.
- You can use `--set` to override properties that are defined in your values file, or add additional properties that are not present in your values file.

6. Verify your installation.

This is done by listing the `Deployments` and `Pods` in your namespace. If installation is successful, a Cloudera Surveyor `Deployment` and two `Pods` will be present in the cluster.

```
kubectl get deployments --namespace [***NAMESPACE***]
```

NAME		READY	UP-TO-DATE	AVAILABLE	AGE
#...					
cloudera-surveyor	2/2	2	2	13m	

```
kubectl get pods --namespace [***NAMESPACE***]
```

NAME	READY	STATUS	RESTARTS	AGE
#...				
cloudera-surveyor-649f755f6d-689gx	1/1	Running		0
13m				
cloudera-surveyor-649f755f6d-xj2kp	1/1	Running		0
13m				

7. Access the Cloudera Surveyor UI.

Installation by default creates a `NodePort` type `Service` for Cloudera Surveyor. The UI is accessible from any of the Kubernetes cluster nodes on the external port of the `Service`. List `Services` to get the external port.

```
kubectl get service cloudera-surveyor-service --namespace [***NAMESPACE***]
```

NAME (S)	AGE	TYPE	CLUSTER-IP	EXTERNAL-IP	PORT
cloudera-surveyor-service	16m	NodePort	10.43.196.52	<none>	808
0:30525/TCP					

In this example, the external port is 30525.

Results

Cloudera Surveyor is installed. You can now manage and monitor your Kafka clusters using the UI.

Installing Strimzi on Taikun CloudWorks [Technical Preview]

Learn how to install Strimzi in Cloudera Streams Messaging - Kubernetes Operator on Taikun CloudWorks. Installation involves importing the Cloudera Kafka Operator repository, adding Strimzi to a new or existing catalog, and installing Strimzi using the Taikun CloudWorks UI.

Before you begin

Note: This feature is in Technical Preview and is not ready for production deployments. Cloudera recommends trying this feature in test or development environments and encourages you to provide feedback on your experiences.

- You have access to a project and Kubernetes cluster in Taikun CloudWorks.
- Your Kubernetes environment meets requirements listed in [System requirements](#).
- The worker nodes in your cluster meet the minimum sizing requirements listed in [Sizing and performance considerations](#).
- Access to your cluster with `kubectl` is configured. For more information, see [Accessing Cluster with Kubeconfig](#).
- Your Kubernetes cluster requires internet connectivity to complete these steps. It must be able to reach the Cloudera Docker registry.
- You have access to your Cloudera credentials (username and password). Credentials are required to access the Cloudera Archive and Cloudera Docker registry where installation artifacts are hosted.
- You have access to a valid Cloudera license.
- Review the [Helm chart reference](#) before installation.

The Helm chart accepts various configuration properties that you can set during installation. Using these properties you can customize your installation.

- If you are planning to watch and manage more than 20 Kafka clusters with a single installation, you must increase the memory and heap allocated to the Strimzi Cluster Operator. For more information, see [Increasing Cluster Operator memory](#).

Importing the Cloudera Kafka Operator repository and adding Strimzi to a catalog

Complete these steps to import the Cloudera Kafka Operator repository and to add Strimzi to a new or existing catalog in Taikun CloudWorks.

Procedure

1. Import the Cloudera Kafka Operator repository.

a) In Taikun CloudWorks, go to Repositories and select the Private tab.

b) Click  Import Repository.

c) Enter the following in Import Repository:

- Enter a unique name in Name.
- Enter the following OCI repository URL in URL:

```
oci://container.repository.cloudera.com/cloudera-helm/csm-operator/s
trimzi-kafka-operator
```

- Enter your Cloudera credentials in Username and Password.

d) Click Import.

2. Add Strimzi to a catalog.

Tip: These instructions create a new catalog. You can also add your application to an existing catalog.

a) Go to Catalogs and click  Add Catalog.

b) Enter a catalog name and description in Create Catalog.

c) Click Save.

d) Go to [***YOUR CATALOG***] and click  Add Applications.

e) Select [***YOUR REPOSITORY***] from the Repository drop-down list and click Apply.

f) Find the strimzi-kafka-operator application in the list of available applications and click .

g) Click  Add to the catalog.

3. Add catalog app parameters.

a) Click Add Parameters.

b) Find and add the following parameters:

- watchAnyNamespaces
- clouderaLicense.secretRef

c) Set the following default values for the parameters you added:

- watchAnyNamespaces=true
- clouderaLicense.secretRef=csm-op-license

d) Click Save.

Installing Strimzi

Complete these steps to install Strimzi on Taikun CloudWorks.

Procedure

1. Create a namespace in your Kubernetes cluster.

```
kubectl create namespace [***NAMESPACE***]
```

Use this namespace in all of the following installation steps.

2. Create a Kubernetes Secret containing your Cloudera license.

```
kubectl create secret generic csm-op-license \
  --namespace [***NAMESPACE***] \
  --from-file=license=[***PATH TO LICENSE FILE***]
```

3. Create a Kubernetes Secret containing your Cloudera credentials.

```
kubectl create secret docker-registry [***REGISTRY CREDENTIALS SECRET***] \
  --namespace [***NAMESPACE***] \
  --docker-server container.repository.cloudera.com \
  --docker-username [***USERNAME***] \
  --docker-password "$(echo -n 'Enter your Cloudera password: ' >&2; read
-s password; echo >&2; echo $password)"
```

- Take note of the name you specify as `[***REGISTRY CREDENTIALS SECRET***]`. You will need to specify the name in a later step.
- Replace `[***USERNAME***]` with your Cloudera username.
- Enter your Cloudera password when prompted.

4. Install Strimzi.

a) In Taikun CloudWorks, go to Projects `[***YOUR PROJECT***]` Applications .

b) Click  Install.

c) Search for strimzi-kafka-operator.

d) Find the strimzi-kafka-operator application in the list of available applications. Select the one that is in `[***YOUR CATALOG ***]` and click .

e) Click Bind if you get a prompt to bind the catalog to your project.

f) Configure the following common settings in Application Instance:

- Enter a name in Application Instance Name.
- In Namespace, select the namespace you created in Step 1.
- Enable the Extra Values tab by clicking the Extra Values toggle.

g) Click Continue.

h) Configure the following parameters in Installation Params:

- Set the watchAnyNamespace toggle to enabled.
- Set clouderaLicense.secretRef to the name of the Secret you created in Step 2.

Tip: Required parameters might already use correct default values.

i) Click Continue.

j) Provide the following values in Extra Values:

```
image:
  imagePullSecrets:
```

```
- name: [***REGISTRY CREDENTIALS SECRET***]
```

Replace [***REGISTRY CREDENTIALS SECRET***] with the name of the `Secret` you created in Step 3.

k) Validate your extra values by clicking `Check extra values`.

l) Click  `Run installation`.

5. Go to `Projects [***YOUR PROJECT***] LiveOps` to verify your installation.

If installation is successful, a `Strimzi Deployment` and `Pod` will be present in the cluster in the installation namespace. These resources use the name you specified in `Application Instance Name`.

What to do next

- Deploy a Kafka cluster, see [Deploying Kafka](#).

Note: When deploying a Kafka cluster on Taikun CloudWorks, use ingress type listeners, set the Ingress class to taikun, and ensure that bootstrap and broker hostnames resolve to your cluster.

Installing Cloudera Surveyor for Apache Kafka on Taikun CloudWorks [Technical Preview]

Learn how to install Cloudera Surveyor in Cloudera Streams Messaging - Kubernetes Operator on Taikun CloudWorks. Installation involves importing the Cloudera Surveyor repository, adding Cloudera Surveyor to a new or existing catalog, and installing Cloudera Surveyor using the Taikun CloudWorks UI.

Before you begin

Note: This feature is in Technical Preview and is not ready for production deployments. Cloudera recommends trying this feature in test or development environments and encourages you to provide feedback on your experiences.

- You have access to a project and Kubernetes cluster in Taikun CloudWorks.
- Your Kubernetes environment meets requirements listed in [System requirements](#).
- The worker nodes in your cluster meet the minimum sizing requirements listed in [Sizing and performance considerations](#).
- Access to your cluster with `kubectl` is configured. For more information, see [Accessing Cluster with Kubeconfig](#).
- Your Kubernetes cluster requires internet connectivity to complete these steps. It must be able to reach the Cloudera Docker registry.
- You have access to your Cloudera credentials (username and password). Credentials are required to access the Cloudera Archive and Cloudera Docker registry where installation artifacts are hosted.
- You have access to a valid Cloudera license.
- Review the [Helm chart reference](#) before installation.

The Helm chart accepts various configuration properties that you can set during installation. Using these properties you can customize your installation.

Importing the Cloudera Surveyor repository and adding Cloudera Surveyor to a catalog

Complete these steps to import the Cloudera Surveyor repository and to add Cloudera Surveyor to a new or existing catalog in Taikun CloudWorks.

Procedure

1. Import the Cloudera Surveyor repository.
 - a) In Taikun CloudWorks, go to Repositories and select the Private tab.
 - b) Click  Import Repository.
 - c) Enter the following in Import Repository:
 - Enter a unique name in Name.
 - Enter the following OCI repository URL in URL:

```
oci://container.repository.cloudera.com/cloudera-helm/csm-operator/surveyor
```

- Enter your Cloudera credentials in Username and Password.
- d) Click Import.
 2. Add Cloudera Surveyor to a catalog.

Tip: These instructions create a new catalog. You can also add your application to an existing catalog.

- a) Go to Catalogs and click  Add Catalog.
- b) Enter a catalog name and description in Create Catalog.
- c) Click Save.
- d) Go to [***YOUR CATALOG***] and click  Add Applications.
- e) Select [***YOUR REPOSITORY***] from the Repository drop-down list and click Apply.
- f) Find the surveyor application in the list of available applications and click .
- g) Click  Add to the catalog.
3. Add catalog app parameters.
 - a) Click Add Parameters.
 - b) Find and add the clouderaLicense.secretRef parameter.
 - c) Set the clouderaLicense.secretRef parameter to csm-op-license.
 - d) Click Save.

Installing Cloudera Surveyor

Complete these steps to install Cloudera Surveyor on Taikun CloudWorks.

About this task

These instructions walk you through installing an unsecure instance of Cloudera Surveyor on Taikun CloudWorks. Use these instructions for quick installation in development environments for proof of concept and evaluation purposes.

While the security configuration of Cloudera Surveyor itself is not covered, the example configuration demonstrates how to register a Kafka cluster that has TLS encryption enabled.

Procedure

1. Create a namespace in your Kubernetes cluster.

```
kubectl create namespace [***NAMESPACE***]
```

Use this namespace in all of the following installation steps.

2. Create a Kubernetes Secret containing your Cloudera license.

```
kubectl create secret generic csm-op-license \
  --namespace [***NAMESPACE***] \
  --from-file=license=[***PATH TO LICENSE FILE***]
```

3. Create a Kubernetes Secret containing your Cloudera credentials.

```
kubectl create secret docker-registry [***REGISTRY CREDENTIALS SECRET***] \
  --namespace [***NAMESPACE***] \
  --docker-server container.repository.cloudera.com \
  --docker-username [***USERNAME***] \
  --docker-password "$(echo -n 'Enter your Cloudera password: ' >&2; read
  -s password; echo >&2; echo $password)"
```

- Take note of the name you specify as `[***REGISTRY CREDENTIALS SECRET***]`. You will need to specify the name in a later step.
- Replace `[***USERNAME***]` with your Cloudera username.
- Enter your Cloudera password when prompted.

4. Create Secrets for sensitive Kafka client configuration values.

Cloudera Surveyor connects to Kafka clusters as any other Kafka client and requires a client configuration. If the Kafka cluster is secured, the client configuration will include sensitive property values. Cloudera recommends that you store sensitive values in **Secrets**, mount the **Secrets** to the Cloudera Surveyor Container, and reference the values in your configuration instead of hard-coding them.

Typically, you need to create two **Secrets**. One contains the Kafka cluster truststore and password, and the other contains a JAAS configuration. The Kafka truststore must be in JKS or PKCS12 format.

```
kubectl create secret generic [***KAFKA TRUSTSTORE SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-file=[***KAFKA TRUSTSTORE KEY***]=[***PATH TO TRUSTSTORE***] \
  --from-file=[***KAFKA TRUSTSTORE PASSWORD KEY***]=[***PATH TO TRUSTSTORE
  PASSWORD FILE***]
```

```
kubectl create secret generic [***KAFKA SASL.JAAS.CONFIG SECRET***] \
  --namespace [***NAMESPACE***] \
  --from-file=[***KAFKA SASL.JAAS.CONFIG KEY***]=[***PATH TO KAFKA
  SASL.JAAS.CONFIG FILE***]
```

- Take note of the **Secret** names as well as the key names you configure. You will need to specify them in a later step.
- All key names like `[***KAFKA TRUSTSTORE KEY***]` or `[***KAFKA SASL.JAAS.CONFIG KEY***]` are arbitrary.

- `[***PATH TO KAFKA SASL.JAAS.CONFIG FILE***]` is a path to a file containing JAAS configuration similar to the following example:

```
org.apache.kafka.common.security.plain.PlainLoginModule required username="MY-USER" password="MY-PASSWORD";
```

The contents of this file are set in a later step as the value of the `sasl.jaas.config` Kafka client property for Cloudera Surveyor internal Kafka clients. Ensure that the format of the configuration is valid for the `sasl.jaas.config` property. That is, its a single line of configuration.

5. Install Cloudera Surveyor.

- In Taikun CloudWorks, go to Projects `[***YOUR PROJECT***]` Applications .
- Click  Install.
- Search for surveyor.
- Find the surveyor application in the list of available applications. Select the one that is in `[*** YOUR CATALOG ***]` and click .
- Click Bind if you get a prompt to bind the catalog to your project.
- Configure the following common settings in Application Instance:
 - Enter a name in Application Instance Name.
 - In Namespace, select the namespace you created in Step 1.
 - Enable the Extra Values tab by clicking the Extra Values toggle.
- Click Continue.
- In Installation Params, set `clouderaLicense.secretRef` to the name of the `Secret` you created in Step 2.

Tip: Required parameters might already use correct default values.

- Click Continue.
- Provide the following values in Extra Values:

```
image:
  imagePullSecrets: [***REGISTRY CREDENTIALS SECRET***]
clusterConfigs:
  clusters:
    - clusterName: [***CLUSTER NAME***]
      tags:
        - [***TAG1***]
        - [***TAG2***]
      bootstrapServers: [***BOOTSTRAP SERVERS***]
      commonClientConfig:
        security.protocol: "SSL"
        ssl.truststore.type: "pkcs12"
        ssl.truststore.location: "/opt/secrets/[***KAFKA TRUSTSTORE SECRET***]/[***KAFKA TRUSTSTORE FILE***]"
        ssl.truststore.password: "\\${dir:/opt/secrets/[***KAFKA TRUSTSTORE SECRET***]:[***KAFKA TRUSTSTORE PASSWORD FILE***]}\"
        sasl.jaas.config: "\\${dir:/opt/secrets/[***KAFKA SASL.JAAS.CONFIG SECRET***]:[***KAFKA SASL.JAAS.CONFIG FILE***]}\"
        adminOperationTimeout: PT1M
      authorization:
        enabled: false
  secretsToMount:
    - create: false
      secretRef: [***KAFKA TRUSTSTORE SECRET***]
      items:
        - key: [***KAFKA TRUSTSTORE KEY***]
          path: [***KAFKA TRUSTSTORE FILE***]
        - key: [***KAFKA TRUSTSTORE PASSWORD KEY***]
```

```

    path: [***KAFKA TRUSTSTORE PASSWORD FILE***]
  - create: false
    secretRef: [***KAFKA SASL.JAAS.CONFIG SECRET***]
    items:
      - key: [***KAFKA SASL.JAAS.CONFIG KEY***]
        path: [***KAFKA SASL.JAAS.CONFIG FILE***]
surveyorConfig:
  surveyor:
    authentication:
      enabled: false
  tlsConfigs:
    enabled: false
  ingress:
    enabled: true
    protocol: HTTP
    className: taikun
  rules:
    host: "[***SUBDOMAIN***].[***DOMAIN NAME***]"

```

For image

image contains all configuration settings for the container image. This can include the image repository, tag version, pull policy, and any required authentication Secrets for accessing the registry.

In this example, image.imagePullSecrets is set. This property specifies the Secret that contains your Cloudera credentials. These credentials are used to access the Cloudera Docker registry to pull required images. Replace [***REGISTRY CREDENTIALS SECRET***] with the name of the Secret you created in Step 3.

For clusterConfigs

clusterConfigs specifies the Kafka clusters that Cloudera Surveyor connects to. Clusters specified here are the ones that will be available on the UI for monitoring and management. For more information and additional examples, see [Registering Kafka clusters](#).

- clusterConfigs.clusters[*] – An array of Kafka clusters and their configuration. Each entry defines the configuration for a single Kafka cluster.
- clusterConfigs.clusters[*].clustername – The name of the cluster. This name is displayed on the UI.
- clusterConfigs.clusters[*].bootstrapServers – A comma-separated list of the bootstrap servers for the Kafka cluster that Cloudera Surveyor connects to. Specify multiple servers for highly available connections.
- clusterConfigs.clusters[*].tags – User defined tags. Used for organization and filtering.
- clusterConfigs.clusters[*].commonClientConfig – Kafka client configuration properties applied to all clients for this cluster. Must contain upstream Kafka client properties as a map. The exact properties that you specify here depend on the security configuration of the Kafka cluster that you want to connect. This example specifies a Kafka cluster that uses PLAIN authentication with TLS.

Sensitive property values are referenced from Secrets instead of being hardcoded. Secrets containing sensitive properties are mounted using the secretsToMount property. References use Kafka DirectoryConfigProvider syntax.

Note: References in the client configurations must be escaped because Cloudera Surveyor itself uses the same syntax for references.

- `clusterConfigs.clusters[*].authorization.enabled` – Enables or disables authorization for this cluster.

For `secretsToMount`

`secretsToMount` specifies the **Secrets** to mount in the Cloudera Surveyor **Container**. You use `secretsToMount` to mount the sensitive values required for Kafka client configuration specified in `clusterConfigs`. For more information and additional examples, see [Managing sensitive data in client configuration](#)

- `secretsToMount[*].create` – Specifies whether to create the **Secret**. Set to `false` in this example as the **Secrets** are assumed to already exist.
- `secretsToMount[*].secretRef` – The name of the **Secret** to mount.
- `secretsToMount[*].items[*].key` – The key in the **Secret** to mount.
- `secretsToMount[*].items[*].path` – The path where the item is mounted. The path is relative to `/opt/secrets/` `[***SECRET NAME***]` in the Cloudera Surveyor **Container**.

For `ingress`

`ingress` enables the creation of an **Ingress**. The **Ingress** provides secure external access to the Cloudera Surveyor UI.

- `ingress.enabled` – Enables or disables **Ingress**.
- `ingress.protocol` – Configures the **Ingress** protocol.
- `ingress.className` – The class name of the **Ingress** controller. This example configures the **Ingress-Nginx** controller.
- `ingress.rules.host` – Specifies the DNS hostname that the **Ingress** controller should match for incoming HTTP/HTTPS requests.

Configure this property as follows:

- `[***SUBDOMAIN***]` – Arbitrary and unique subdomain or service name that identifies the application. For example: `surveyor`.
- `[***DOMAIN NAME***]` – A domain that resolves to the access IP of your Kubernetes cluster.

If you do not have DNS configured or do not know your domain, use a wildcard DNS service like `sslip.io`. If you use a wildcard DNS service, the value you enter must have the following format:

```
[***SUBDOMAIN***].[***ACCESS IP***].[***WILDCARD DNS SERVICE***]
```

For example:

```
surveyor.203.0.113.255.sslip.io
```

You can find the access IP of the cluster in Taikun CloudWorks by going to **Projects** `[***YOUR PROJECT***]`

k) Validate your extra values by clicking **Check extra values**.

l) Click  **Run installation**.

6. Go to **Projects** `[***YOUR PROJECT***]` **LiveOps** to verify your installation.

If installation is successful, a **Cloudera Surveyor Deployment** and two **Pods** will be present in the cluster in the installation namespace. These resources use the name you specified in **Application Instance Name**.

7. Access the Cloudera Surveyor UI.

You can access the UI through the host you configured in `ingress.rules.host`.

Results

Cloudera Surveyor is installed. You can now manage and monitor your Kafka clusters using the UI.

Installing from OperatorHub in OpenShift

Learn how to install Cloudera Streams Messaging - Kubernetes Operator from OperatorHub in OpenShift.

About this task

Important: When installing from OperatorHub, Cloudera Streams Messaging - Kubernetes Operator is installed using Operator Lifecycle Manager (OLM). Customizing your installation and setting the properties of the Strimzi Cluster Operator is limited both during and following installation.

Installation from OperatorHub in Openshift involves creating two **Secrets** in your installation namespace. One containing your Cloudera license, and one containing your Cloudera credentials (username and password). The license is required for Cloudera Streams Messaging - Kubernetes Operator to function properly. The credentials provide access to the Cloudera Docker registry (container.repository.cloudera.com) where installation artifacts are pulled from.

After the **Secrets** are available in your cluster, you can continue with the standard process of installing operators from OperatorHub.

Before you begin

- Ensure that you have access to your Cloudera credentials (username and password).
- You have access to a valid Cloudera license.
- These instructions use `oc` to create **Secrets**. However, you can also create both **Secrets** using the OpenShift web console.

Procedure

1. Create a **Secret** containing your license.

The name of the **Secret** is fixed. It must be called `csm-op-license`.

```
oc create secret generic csm-op-license --from-file=license.txt=[***PATH TO LICENSE FILE***]
```

2. Create a **Secret** containing your Cloudera credentials.

The name of the **Secret** is fixed. It must be called `cloudera-container-repository-credentials`.

```
oc create secret docker-registry cloudera-container-repository-credentials \
--docker-username=[***USERNAME***] \
--docker-password=[***PASSWORD***] \
--docker-server=container.repository.cloudera.com
```

Note: The **Secret** containing your Cloudera credentials must also be available in all namespaces where you deploy Kafka or Kafka Connect clusters. Cloudera recommends that you create the **Secret** in all required namespaces now if you know what namespaces you will be using to deploy Kafka or Kafka Connect.

3. Install Cloudera Streams Messaging - Kubernetes Operator from OperatorHub using the web console or the CLI.
For detailed steps, see [Adding Operators to a cluster](#) in the OpenShift documentation.

What to do next

- Deploy a Kafka cluster, see [Deploying Kafka](#).
- Set up Prometheus for monitoring, see [Configuring Kafka for Prometheus monitoring](#) and [Monitoring with Prometheus](#).
