Managing Datasets

You can view, create, edit, and delete Datasets.

On the Data Catalog menu, click Datasets to view all the datasets.

Search for Datasets

On the Datasets page, enter a search string in the search box to view all asset collections with names that contain the search string.

Filter Datasets by Tags

You can filter Datasets and view Dataset with the tags. Select the tag from the drop down list or enter the tag in the filter box. Any Dataset with the filter tag assigned to a column will appear in the filter results.

Related Information

Understanding asset collections

Create Datasets

You can group data assets into Datasets. This enables you to organize data based on business classifications, purpose, protection requirements, or more. Examples of Datasets are: customer profiles, sales assets, financials, PII, and HR data.

Procedure

- From the Datasets page, click Add Datasets.
 The Add page appears.
- **2.** Enter the following information.

Field Name	Description	Example Values	
Name	Enter an appropriate dataset name. This name cannot be duplicated across the system. (Mandatory)	Customer Profiles, Sales Assets, Financials	
Description	Describe the purpose or intent of the dataset. (Mandatory)	Contains customer profiles: data assets for US and WW.	
Data Lake	Assign the dataset to one Data lake. Choose from a list of available Data lakes. (Mandatory)	dss_bbsh_clust3	
Tags	Add tags to your dataset for context and subsequent lookup. Tags enable your to quickly catalog, search and retrieve asset collections as well as share such information with others in the future. (Optional)	se, pii, geo, finance	
Public/Private	Select public if you want other users to have access to this dataset. Select private if only you want to have access to this dataset. Note: You can later change the status of the asset collection. Click the lock icon on the Dataset		
	Details page to change the access state of the dataset.		

3. Click Next.

The Dataset Details page appears for the new dataset.

4. Click Add Assets to add related data assets into your dataset.

The Asset Search page appears.

- **5.** Search for assets using Basic Search.
 - a) Search using the name of the asset by entering the name in the search bar.
 - b) Use filters to search for specific assets based on the attributes of assets. Click Filter to display the filters available.
 - Created Time: From the dropdown list, select the time to refine the search on the basis of when the asset has been created.
 - Owner: Enter the name of the owner to refine the search on the basis of the owners of the assets.
 - DB Name: Enter the name of the database.
 - Tag: Enter the names of the tags.
 - c) Select one more than one filter if needed.
 - d) Click Search to view the assets. The Results appear.
 - e) Click Reset to reset the filters and search again.
 - f) From the list, click to select the assets that you like to add to your dataset.
- **6.** Search for assets using Advanced Search, if needed. Advanced search uses facets of technical and business metadata about the assets, such as those captured in Apache Atlas, to help users define and build collections of interest. Advanced search conditions are a subset of attributes for the Apache Atlas type hive_table.
- 7. Click Done.

The assets are added to the dataset and the Search page is refreshed.

8. Close the Search tab.

The Datasets Details page appears.

9. Click Save.

Edit Datasets

You can edit Datasets by adding or removing assets and changing the access state of the Datasets.

Procedure

- 1. Click a Dataset in the list to edit it. The Details page of that Dataset appears.
- 2. On the Assets tab, click Edit to edit the content of this Dataset. The Dataset appears in edit mode. If another user is editing this Dataset, an error message will appear saying that this Dataset is being edited by another user and you cannot edit it.
- 3. Add or remove assets in the Dataset.
 - a) Click Add to add new assets to this Dataset.
 - b) Select one or more assets and click Remove to remove assets from this Dataset.
- 4. Click Save to save the changes that you made to the Dataset.
- 5. Click Cancel to undo any changes that you made to this Dataset.

Note: You also can edit the metadata (name, description, and tags) of the datasets. Being an owner of specific datasets, and making them private, you can update the name, description, and tags.

Delete Datasets

You might want to delete an Datasets if you no longer need to track those Datasets, or if you want to reassign those assets to another Dataset. You can delete Datasets at any time. Deleting an Datasets does not delete the assets contained therein, it only disassembles the Datasets. You can re-create Datasets or reassign assets to new Datasets.

Procedure

- From Data Catalog Datasets page, click the More Options icon beside the name of the Dataset you want to delete.
- 2. Click Delete.
- 3. Click Confirm.

You are returned to the Datasets home page.

Collaborate with other users

You can collaborate and share insights with other users in the enterprise regarding various datasets.

You can rate datasets and view the average rating of a dataset. This can help other users to find datasets with higher ratings easily. You can also add your knowledge and insights about the asset collection by adding comments. Other users can respond to your comments or add their comments about each data asset collection.

On the right hand side of each asset collection page, you can see additional details about the dataset. The collaboration details are also displayed in this tab. The tab displays the following details - average rating for the asset collection, the number of likes, the number of comments, and the bookmark icon indicating if the dataset is bookmarked by the current user or not.

You can perform the following collaboration actions for each dataset.

Like a Dataset

You can let other users know that you like a Dataset. The like icon on the Dataset page displays the total number of likes received by this Dataset.

Click the like icon to add the Dataset to your list of liked collections.

Comment and discuss about a Dataset

You might want to share your knowledge or insights about this Dataset with other users. Data Catalog allows you to collaborate with other users by adding comments.

Click the comment icon to add a comment about this Dataset. The Collaborate tab expands. Click Actions menu to reply to an existing comment. You can continue to add comments for each Dataset.

Bookmark the Dataset

In addition to sharing with other users, you can also bookmark Datasets for easy access in the future.

Click the bookmark icon to add the Dataset to your list of bookmarks. This Dataset will appear in the list of bookmarks when you click the Bookmarks link on the left navigation menu.

Rate the Dataset

You can also rate the datasets on a scale of one to five. Click the star icon to rate the open Dataset. The Collaborate tab expands.

Click the stars to provide your own rating. The rating on the Datasets page shows the average of the rating provided by various users. The Rating section also displays the number of votes given for this Dataset.

View the tags of an Dataset

You can add tags while creating the Dataset. You can also click on the tags to search for Datasets with similar tags. There are two types of tags. System tags are automatically generated based on the details of the assets in the Datasets. You can add more tags that appear in the list of user generated tags.

Search for Assets

On the Data Catalog Search page, select a data lake and enter a search string in the search box to view all the assets with details that contain the search string.

When you enter the search terms in Data Catalog Search, you are looking up names, types, descriptions, and other metadata collected by Data Catalog. The search index includes metadata (not data) about your environment and cluster data assets and operations. You can make the search more powerful by associating your own information (business metadata) to the assets that Data Catalog stores.

Related Information

Understanding data assets

Filters

Use filters to refine the overview of all your available assets.

You must have access to at least one data lake to search and filter your results. By default, a data lake is already selected for you if you have access to it.

You can further refine your search results using filters as follows:

- Owner From all the owner names that appear, you can select the owner to further refine the results and display those search results with the selected owner.
- Type Select a database to view all the assets stored in that type of database. By default, only the following options are visible:
 - · Hive Table
 - · HBase Table

Additional Type filters can be added by clicking + Add New Value.

Note: For information purposes, the Database filter is displayed as Namespace in case of HBase tables.

- Entity Tag Use entity tags to refine your search results. You can add business metadata as entity tags in Atlas and use these tags to refine your search results and view the details of the required data asset.
- Created Within You can choose to refine your search results of assets within the data lake to view the data assets created within the last 7 days, 15 days, or 30 days. You can also add custom values such as 5 days or 10 days to view specific information.
- Created Before Depending on the time when the assets were created, you can choose to refine the search results and view data assets created before 1 day, 7 days, or 15 days. You can add custom values to view data assets created before the days of your preference such as 8 days or 12 days.

Note: These two filters (Created Within and Created Before) are applicable only when Atlas provides the created time for the assets.

- Column Tag You can search for the following type of table assets by tags that have been applied on their children entities, that is, columns or column families using the column tags filter:
 - Hive
 - HBase

Glossary - You can filter assets based on business glossary terms. You can search for any asset without any entity
type restrictions.

Click Clear for any filter to clear the selection. You can use a combination of filters to view the required data assets.

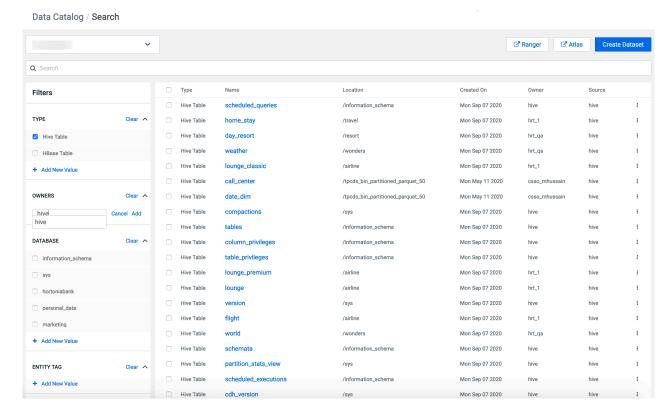

Prepopulating Asset Owners

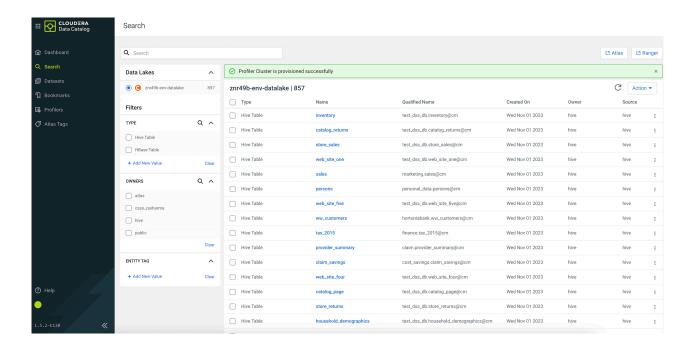

In Data Catalog, under the search page, you can filter for assets based on the owners.

Rather than having to type in the owners manually, the available asset owners are listed in drop down. Select the record from the list and add it as a filter criteria

For example, in the following diagram, the selected asset TYPE is "Hive".

For the selected TYPE the owner "hive" is available in the drop-down and based on this condition, the assets can be filtered in the search page.

Viewing Ranger and Atlas applications

For the selected data lake, click Atlas and Ranger links to navigate to the respective services in a new browser tab.

The Atlas and Ranger buttons seen on the search page of Data Catalog allows you to navigate to the specific Base cluster component.

Clicking on Atlas and Ranger links enables you to sign into the respective services and proceed further.

Note: When you click on Atlas and Ranger buttons, you must separately sign into these services and proceed further.

Accessing Data Lakes

In the Data Catalog search dashboard, the accessible data lakes are displayed under the search panel.

For more information about Data Lakes, see Data Lake Security.

For example, in the following diagram, the logged in user has access to all the listed data lakes.

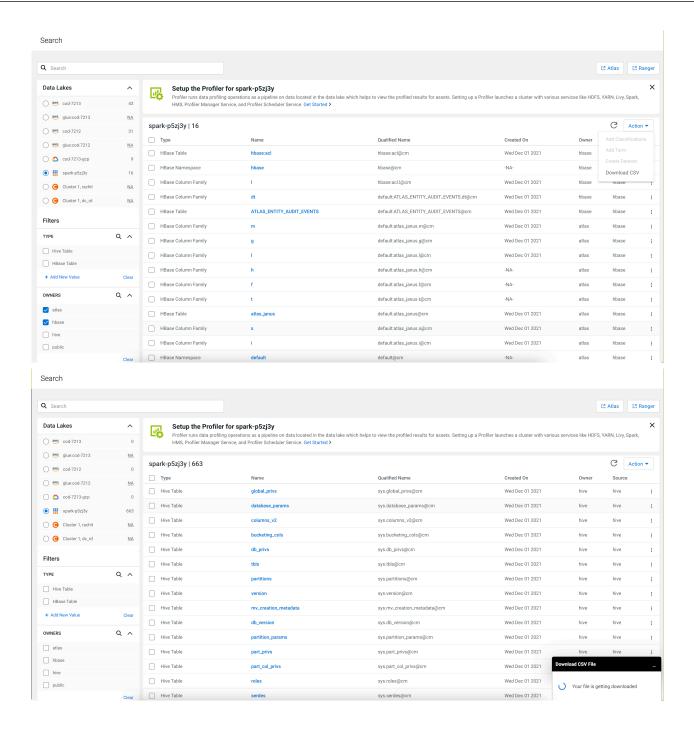

Download CSV option

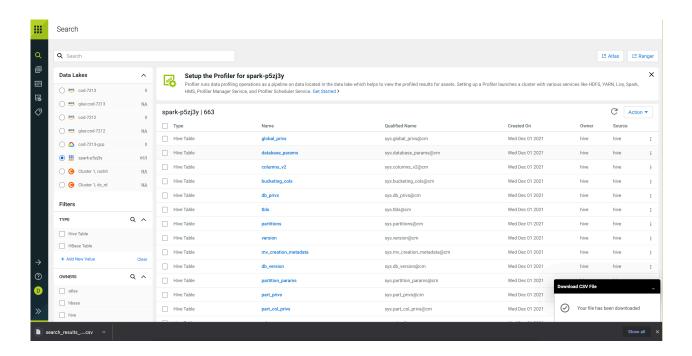

The download CSV feature in Data Catalog allows you to download the search result for the current / specified query with the selected data lake. The feature allows you to download upto 10000 rows for the current search query.

You can access the data lake (OCP / ECS cluster) to query.

The CSV format does not confirm with any specific order or continuation in the downloaded results. For example, a user downloads 10000 assets once and later downloads the CSV again with about 10000 assets. The CSV may not contain the search results in the same order as it was downloaded earlier or previously.

The following example images provides a sample download flow.

Searching for assets using Glossary

Use glossaries to define a common set of search terms that data users across your organization use to describe their data.

Data can describe a wide variety of content: lists of names or text or columns full of numbers. You can use algorithms to describe data as having a specific pattern, of being within a range or having wide variation, but what's missing from these descriptions is what does the data mean in a given business context and what is it used for? Is this column of integers the count of pallets that entered a warehouse on a given day or number of visitors for each room in a conference center?

The glossary is a way to organize the context information that your business uses to make sense of your data beyond what can be figured out just by looking at the content. The glossary holds the terms you've agreed upon across your organization so business users can use familiar terms to find what they are looking for.

Glossaries enable you to define a hierarchical set of business terms that represents your business domain.

Glossary terms can be thought of as of a flat (but searchable) list of business terms organized by glossaries. Unlike classifications, terms are not propagated through lineage relationships: the context of the term is what's important, so propagation may or may not make sense.

Using Terms in Data Catalog

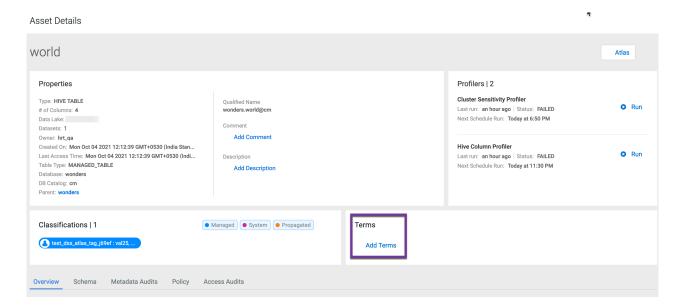

You can use the Asset Details page in Data Catalog to add or modify "terms" for your selected assets.

A new widget called "Terms" is available in the Asset Details page. You can define rich glossary vocabularies using the natural terminology (technical terms and/or business terms). To semantically relate the term(s) to each other. And finally to map assets to glossary terms(s).

You can assign terms with entities, search for entities, filter entities by glossary term(s), and also search for entities by using associated term(s).

Note: When you work with terms in Data Catalog and map them to your assets, you can search for the same datasets in Atlas by using the corresponding terms.

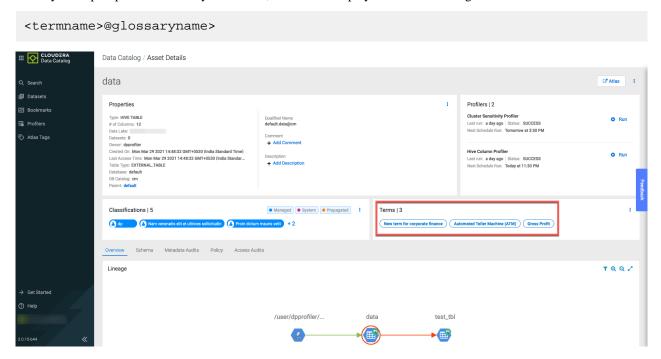

Mapping glossary terms

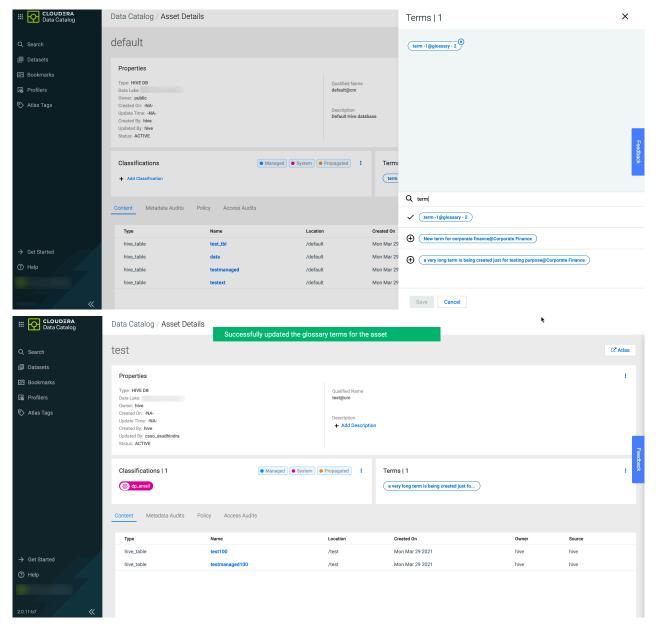

Data Catalog contains the glossary terms that are created in Atlas.

You can search for those terms in Data Catalog and map specific terms with Data assets. You can search for terms in Data Catalog to either add and delete them from the selected data asset. The selected asset displays the total number of terms associated or mapped accordingly.

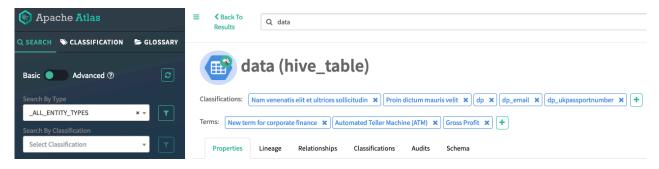

When you map a specific term for your dataset, the term is displayed in the following format:

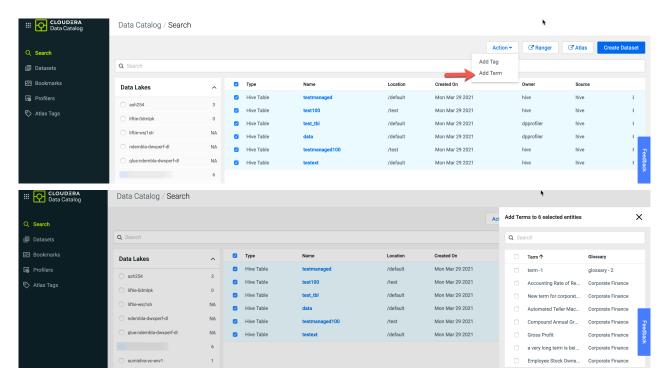

You can use the icon in the Terms widget on the Asset Details page to add new terms for your data assset. Click Save to save the changes.

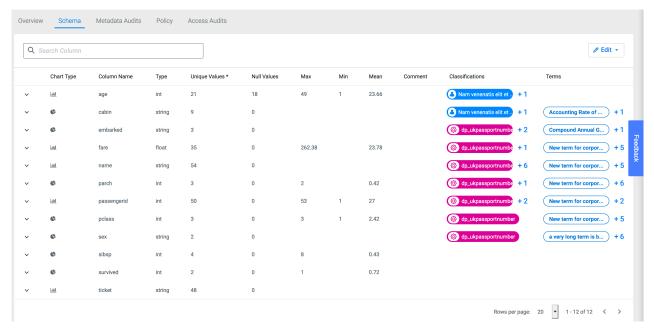

You can search for the same asset in the corresponding Atlas environment as shown in the example image.

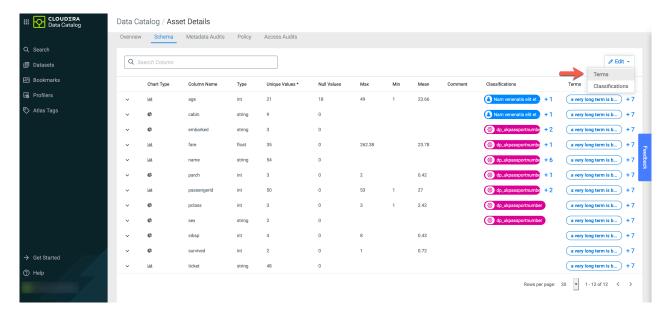

Additionally, you can also associate terms to your datasets by selecting one or more assets on the Data Catalog search page. You can associate terms with multiple datasets at a time.

When you select a Hive table asset and navigate to the Asset Details page, under the Schema tab, you can view the list of terms associated with the asset.

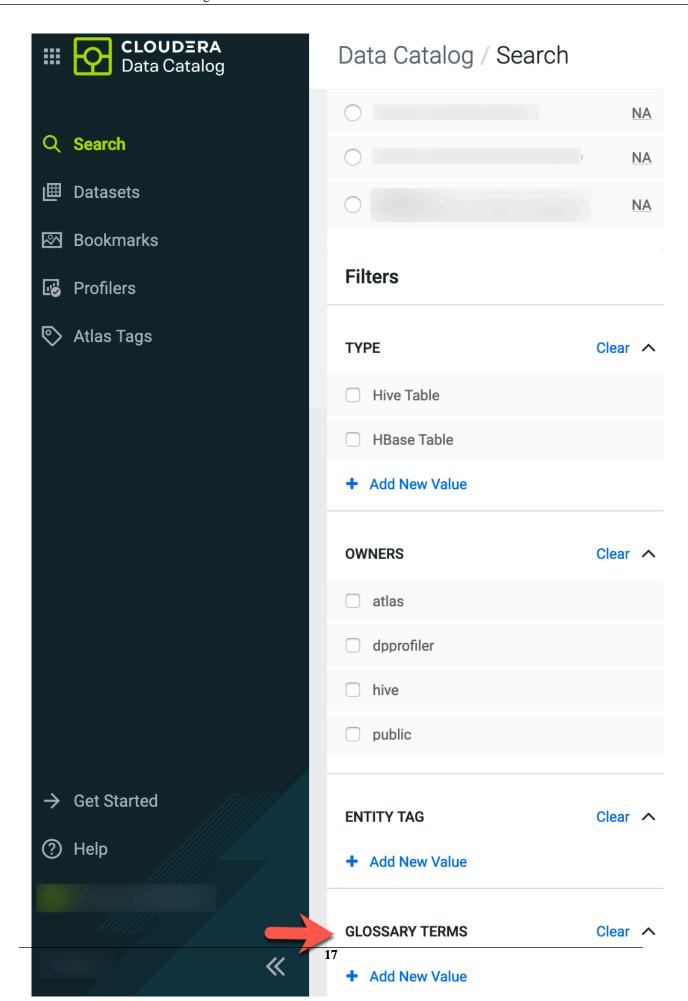

You can add or update the terms for the associated datasets by clicking the Edit button.

Searching for assets using glossary terms

You can search for the datasets using the Glossary terms filter available on the Data Catalog search page.

Additional search options for asset types

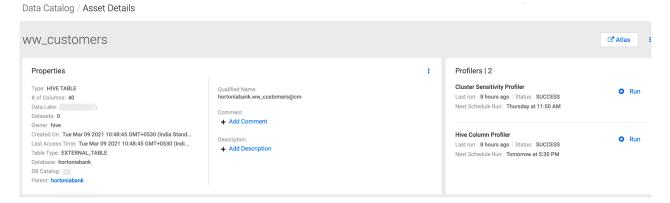

Using Data Catalog, you can add or edit asset description values to search for data assets across both Data Catalog and Atlas services by using the asset content.

In the Asset Details page for each asset type that you select, you can add or edit comment and description fields. For each asset type in Data Catalog, you can add or edit comments or include a description. Including these values for the selected asset helps you to identify your chosen asset when you perform the search operation.

Later, using the same set of values (comment or description), you can search for the asset types in Atlas.

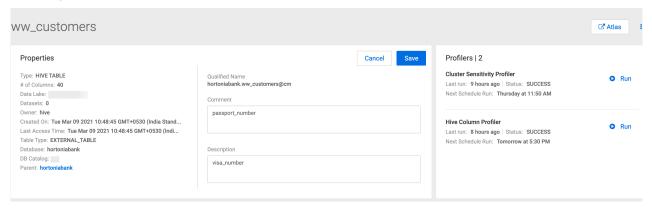

Note: The comment and description options are supported only for Hive table and Hive Column assets. For other asset types, only the description option is supported.

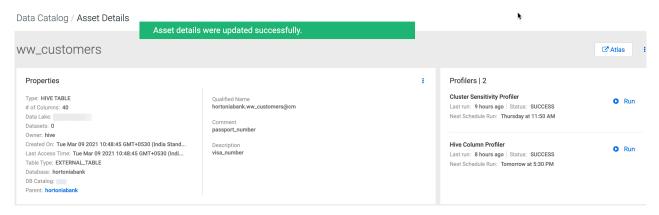

Click + besides Comment and Description to include the respective values.

Data Catalog / Asset Details

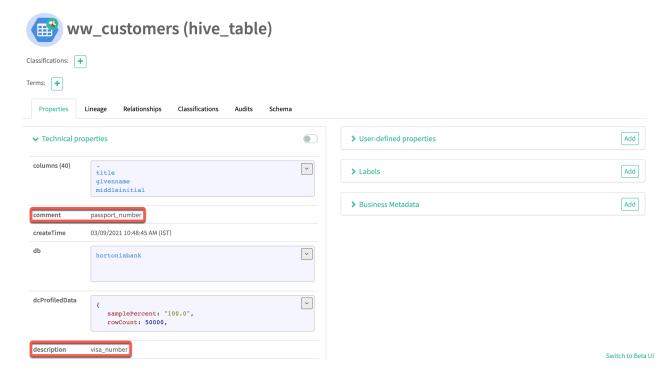

Click Save to save the changes.

Note: You can also edit the already saved valued by clicking the icon.

Clicking on the Atlas button will navigate to the corresponding Atlas asset page as displayed.

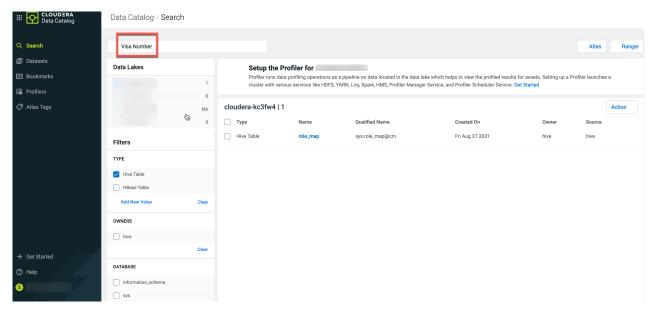

Searching for assets in Data Catalog using additional search options

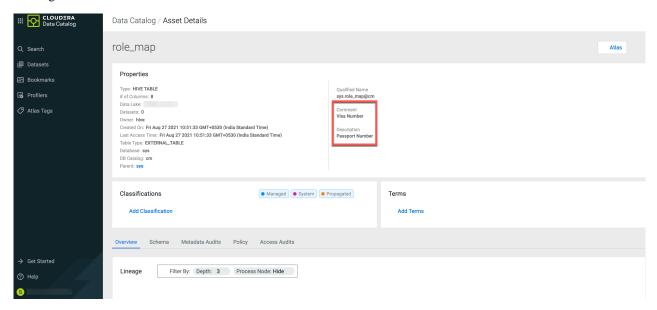

Consider a scenario in Data Catalog, where you select a data asset type and under the Asset Details page, you insert a comment and provide the description for the selected asset.

Navigate to the Data Catalog search query pane and enter the Comment and Description value(s) that you saved for the selected asset type in Data Catalog. The result page displays the asset type that you added for the Comment and Description fields in Data Catalog.

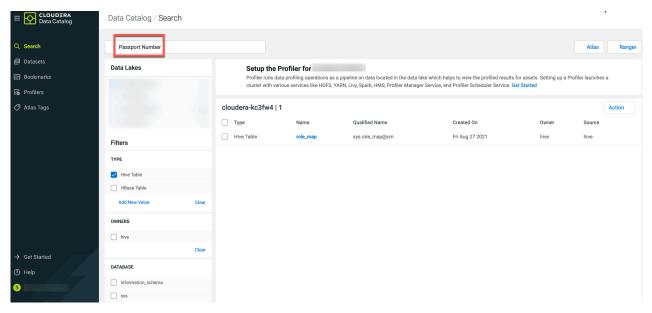

When you query for the entered Comment value for the selected asset type in Data Catalog, the relevant asset type is displayed in the search result page.

Clicking on the asset type in Data Catalog displays the comment and description values as it was assigned in Data Catalog.

When you query for the entered Description value for the selected asset type in Data Catalog, the relevant asset type is displayed in the search result page.

Your search query displays the results.

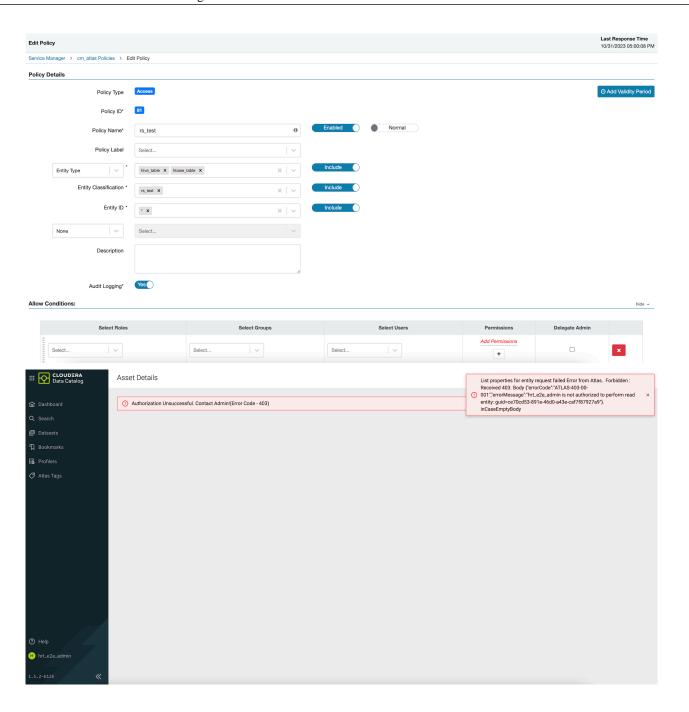

Accessing Tables based on Ranger policies

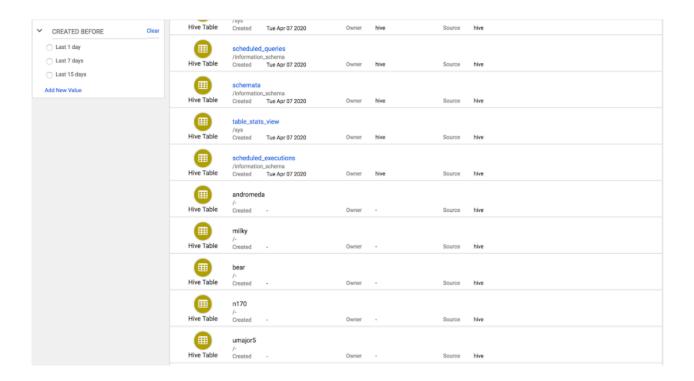

In Data Catalog service, when a table (in blue color link) is clicked, the Asset Details view page is displayed.

If a user is not authorized to click or view table details, it implies that the user permissions have not been set-up in the Ranger.

Note: The user permissions to view table details are configured in Ranger.

Creating Classification for selected assets

You can create a classification that can be associated with an asset.

- **1.** From Data Catalog > navigate to the search page.
- 2. You can perform one or more of the following:
 - Select Add Classifications on action button in search page
 - Select Add classification in classification widget on Asset Details page.
- 3. On the Add Classification slider, click Create button.
- **4.** Enter the necessary values in the fields and click the Create button.

Adding Classifications / Terms for selected assets

You can add classification or terms that can be associated with an asset.

Procedure

- 1. From Data Catalog > navigate to the search page.
- 2. You can perform one or more of the following:
 - a) Select Add Classifications / Terms on action button in the search page.
 - b) Select Add Classifications / Terms in classification widget on Asset Details page.
- 3. On the Add Classifications / terms slider, click on the Add icon against classification / term.
- 4. Enter other values in the fields, if required and click Save.

Additional Entity type selection for searching Assets

Using the Data Catalog service, you can search for assets by using the entity types.

Data Catalog users can search and discover assets of more types. Users can search assets of types just like they do for Hive Table with some restrictions.

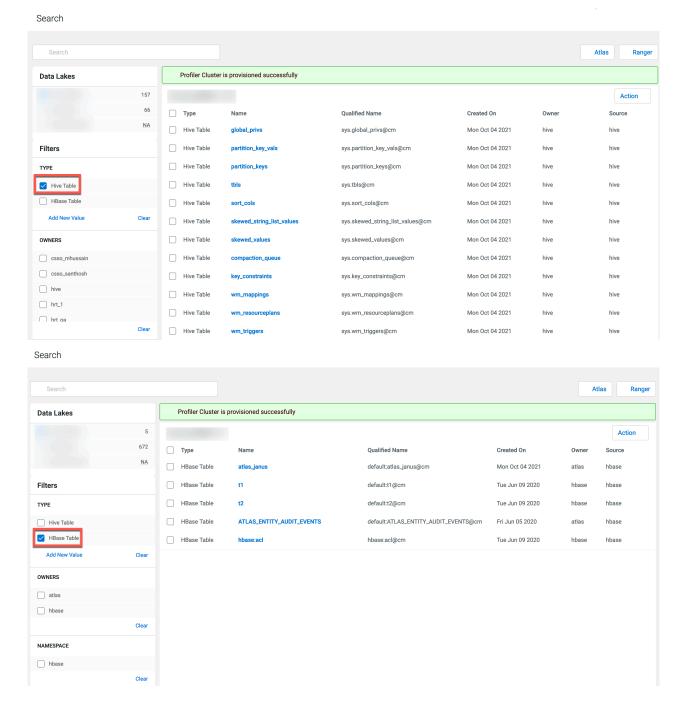

Supported entity types include:

- HBase Table
- HBase Column Family
- HBase Namespace
- HDFS Path
- Hive DB
- · Hive Table
- · Hive Column
- ML Project
- ML Model Build
- ML Model Deployment
- NiFi Flow
- NiFi Data
- Impala Process
- Impala Column Lineage
- Impala Process Execution
- Kafka Topic
- RDBMS DB
- · RDBMS Column
- RDBMS Foreign Key
- RDBMS Index
- RDBMS Instance
- RDBMS Table
- Spark Process
- · Spark Application
- Spark Column
- Spark Column Lineage
- Spark DB
- Spark ML Directory
- Spark ML Model
- Spark ML Pipeline
- Spark Process Execution
- · Spark Table

Selecting a type triggers a search query for that type. Currently two types of entities are supported but totally about twelve types of generic entities can be selected to search for assets depending on the data lake.

Owners data is derived from the response received from type based queries.

The following example diagrams depict the entity type selection search results.

Viewing Data Asset Details

The Asset Details page comprises four to five tabs (Overview, Schema, Metadata Audit, Policy, and Access Audits).

To access the Asset Details page, click an asset in the Data Catalog Search page. This brings you to the Overview tab, the first of the four tabs that form the Asset Details page.

- Asset properties: Number of rows, number of columns, number of partitions, and owner.
- · Overview: Displays an overview for the data asset.
 - Lineage: Shows the chain of custody for the data from relevant metadata repositories such as Apache Atlas. Lineage shows both upstream paths (lineage) into and downstream paths (impact) out of a given asset.

- Schema: Displays the schema of the data asset for structured data (such as Hive tables) from the relevant metadata repositories (such as Atlas).
- Metadata Audits: Displays the change logs per asset fetched from Apache Atlas.
- Content: Only visible for container types like databases. When the tab is visible, the overview tab is not applicable.
- Policy: The policy view shows security (authorization) policies defined on assets such as those present in Apache Ranger. It includes both resource (physical asset based) as well as classification based policies
- Access Audits: The data asset audit logs page shows the most recent access audits from Apache Ranger.

Viewing Data Assets

The Data Asset Overview page displays all the Apache Atlas metadata associated with a particular data asset.

About this task

The Data Asset Overview page displays:

Asset properties: Displays properties information relevant to asset type, like in case of Hive table - Number of rows, number of columns, number of partitions, and the owner.

From the Data Catalog search page, click to select a data asset.

The Asset Overview window opens.

The following matrix captures the supported fields for different asset types:

Asset Type	Lineage	Tagging	Access Metrics	Schema	Policy	Audit	Atlas Punch out
Hive DB	Not Supported	Yes	Not Supported	Not Supported	Yes	Yes	Yes
Hive Table	Yes	Yes	Yes	Yes	Yes	Yes	Yes

View Data Asset Schema

From the Asset Details Schema page, you can view the schema of the data asset for structured data (such as Hive tables) from the relevant metadata repositories (such as Atlas).

Procedure

- **1.** From the Data Catalog search page, select an asset. The Asset Overview window opens.
- 2. Click Schema.

The Schema table shows the data asset schema as retrieved from Apache Atlas.

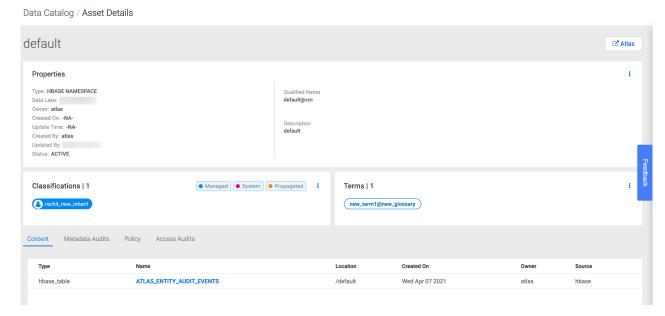

- **3.** (Optional) To edit tags:
 - a) Click Edit Tags.
 - b) Click the (+) icon.
 - c) Select or deselect the tags you choose, then click Save.

You can now manage and edit tags at the table level.

Navigating from the container asset to the parent asset from Asset Details page

A generic Assets Details page is available for container data types like buckets and databases.

The Contents tab (similar to the Schema tab) lists all the contents of the selected entity. Clicking on any element available in the selected entity list navigates you to the Asset Details page.

For example, for a database entity having a list of tables, clicking on any listed table navigates to the Asset Details page of the same table. This page helps you understand the parent-child relationship as far as asset management is concerned. The Contents tab displays entities that are contained within assets of container entity types. The entities in the table of Contents tab are clickable, which will allow you to navigate to the Asset Details page of these contained assets.

The following table lists the entity types, their parent, and contents.

Туре	Parent	Content
Hive DB	-	Hive Table
HBase Namespace	-	HBase Table
ML Project	-	ML Model Build
ML Model Build	ML Project	ML Model Deployment
RDBMS Instance	-	RDBMS DB
RDBMS DB	RDBMS Instance	RDBMS Table

View Authorization Policies on a Data Asset

The Asset Details Policy page displays all the Apache Ranger policy details associated with a particular data asset. This helps you understand how data access is secured and protected: what users can see what data (or metadata) under what conditions (security policies, data protection, and anonymization).

Procedure

 From the Data Catalog search page, select a data asset. The Asset Overview window opens. 2. Click the Policy tab.

The Policy table shows the data asset policies as retrieved from Apache Ranger.

View Data Asset Audit Logs

The Asset Details Audit page displays all the Apache Ranger audit events associated with a particular data asset. This helps you to view who has accessed what data from a forensic audit or compliance perspective, and to visualize access patterns and identify anomalies.

Procedure

- **1.** From the Data Catalog search page, select a data asset. The Asset Overview window opens.
- 2. Click the Audit tab.

The Audit table shows the most recent raw audit event data by type of access and access outcome (authorized/unauthorized).

3. (Optional) You can filter the audit results by Access Type or Result.

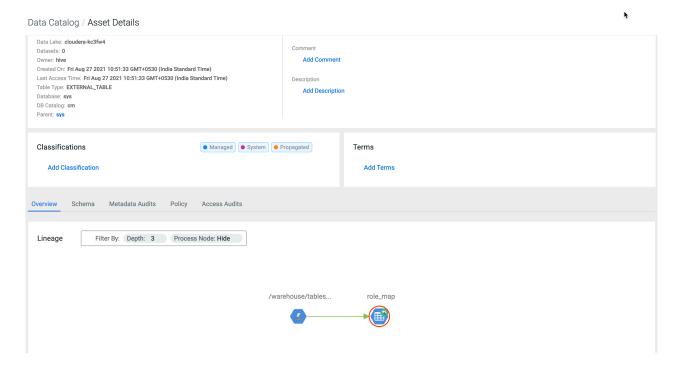

Access type: SELECT, UPDATE, CREATE, DROP, ALTER, INDEX, READ, WRITE.

Result: ALLOWED, DENIED.

Navigation Support for Hive entity within Lineage

When you click a Hive entity within lineage, the Asset Details page of the selected Hive entity is displayed.

Previously, when you clicked on any entity for which slider information was available, a slider would display the entity details. As of now, as seen in the corresponding images, the Asset Details page of the Hive entity is displayed. The option selected in Depth drop-down and Show Process nodes are now displayed on the upper-left corner of the Lineage module.

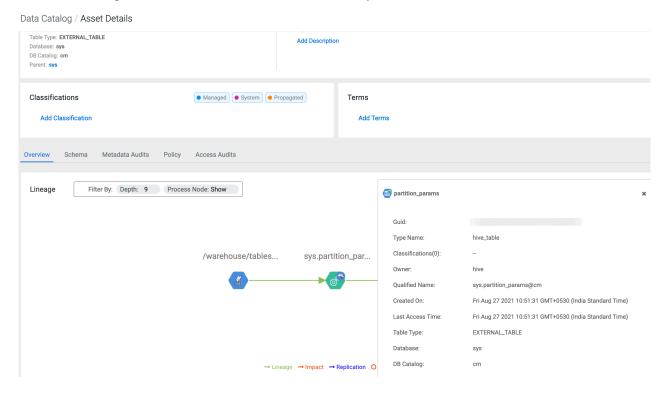

Alternatively, if you do not want to navigate away from the current page and want to view the information with

respect to any entity, hover on the entity and click the information icon

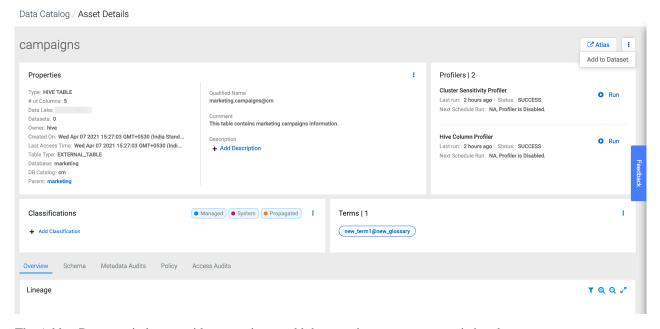

to view the details.

The screenshot depicts the slider information for the clicked entity:

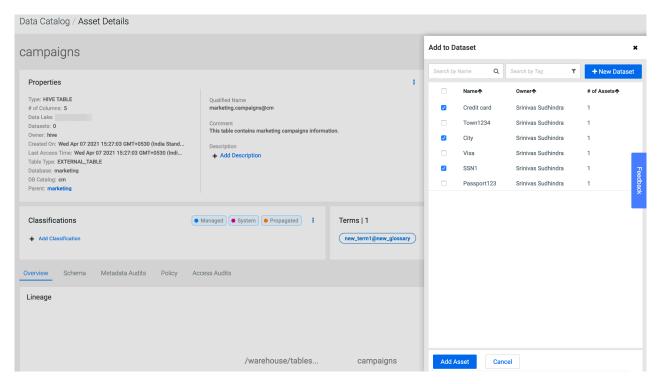

Adding Hive asset to one or more datasets on Asset Details screen

On the Asset Details screen, users are provided with an option to add the asset to the dataset as shown in the diagram.

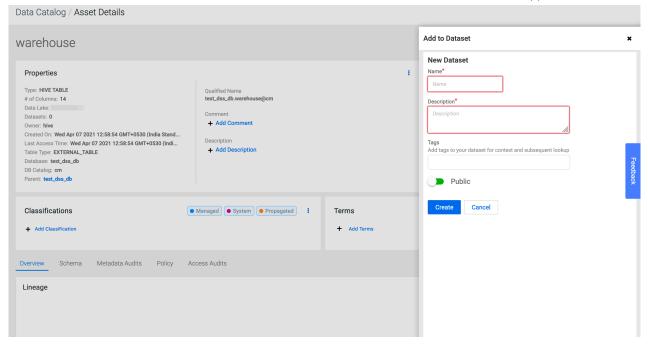

The Add to Dataset window provides an option to add the asset into one or more existing datasets or even create a new one.

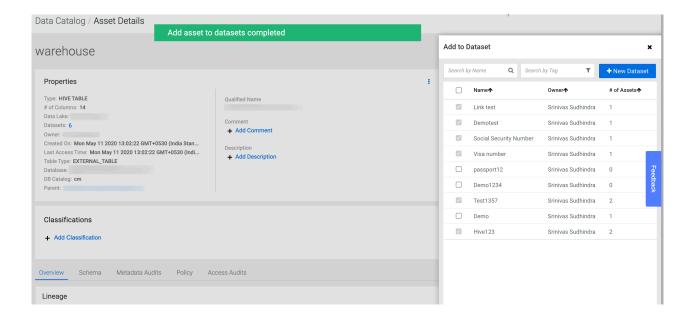

Datasets that already contain the asset are disabled and marked as checked. Datasets which are currently in edit state are disabled and marked with a *.

Users can search for an existing dataset by name or by tags applied on the dataset. Users can select one or more datasets from the list and then click on the Add Asset button which adds the asset to these dataset(s).

There are instances, where there are no datasets present or the user just wants to create a new dataset to add the asset. In that case, the user can click on the New Dataset button which opens up a new dataset form. Once the user fills in the form and clicks on the Create button, a new dataset with the given properties is created and the asset is added to it automatically. This is reflected in the datasets list where the newly added dataset is highlighted.

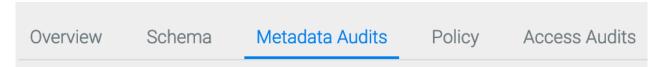

Viewing Atlas Entity Audits

In Data Catalog, Atlas audits help Data Stewards to identify and track the entity changes or modifications that are performed over a period of time.

Information about the Atlas entity audit events are displayed for each entity in the Asset Details page in Data Catalog. Using this information, Data Stewards can distinguish between entity audits and data audits that emanate from Ranger.

On the Asset Details page, a new tab called Metadata Audits displays information related to the selected entity type and about the events that occurred based on the user activities.

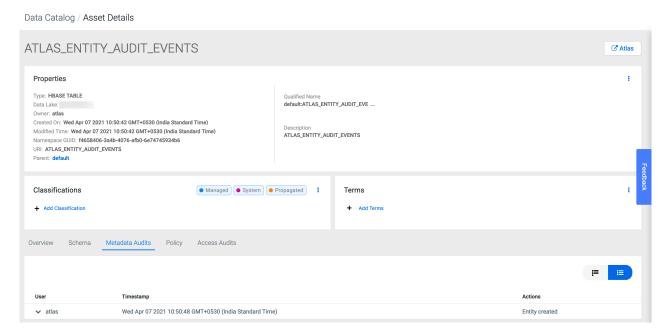

Clicking on Metadata Audits, tab, you can view manage information about:

- · The user who made the changes to the specific entity
- · The time when the entity was changed
- The kind of change that was made to the entity
- Any other relevant changes pertaining to the audit entries

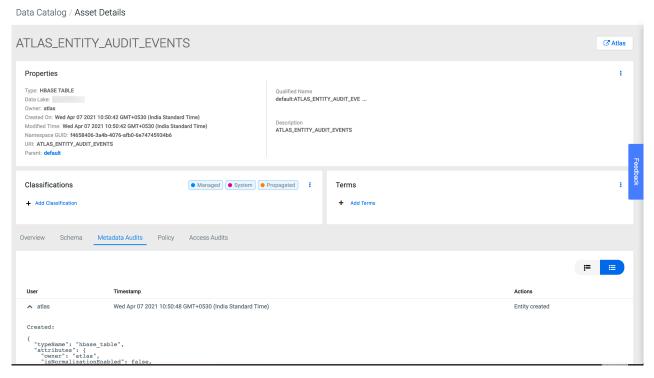

The changes that can be identified for:

- Created entities and related updates
- Tagged entities
- · Labeled entities
- · Export and Import operations

For example, the following image displays information about the Atlas audit events that are performed by each Atlas user that is displayed in the Asset Details page in Data Catalog.

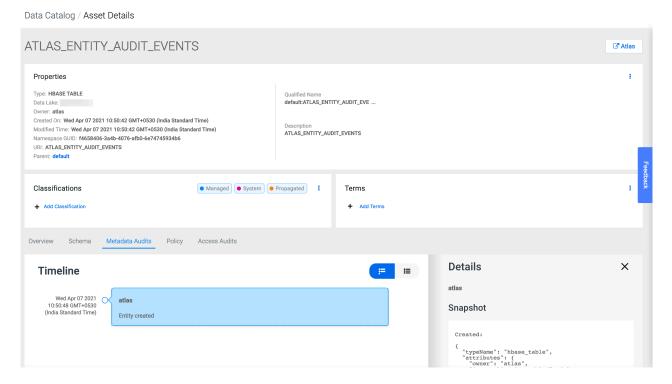

Clicking on any line item displays the JSON format, which is directly derived from Atlas, in other words the source of data available in Atlas.

Use the toggle icon (on the top-right corner) for viewing Atlas Audits in different formats. By default, you can view Metadata Audits in tabular format in the Asset Details page and when you toggle the view icon, you can view the Timeline format. The events are listed as timelines in this format.

Data Catalog / Asset Details ATLAS_ENTITY_AUDIT_EVENTS ☑ Atlas Properties Type: HBASE TABLE default:ATLAS_ENTITY_AUDIT_EVE ... Data Lake: Created On: Wed Apr 07 2021 10:50:42 GMT+0530 (India Standard Time) Modified Time: Wed Apr 07 2021 10:50:42 GMT+0530 (India Standard Time) ATLAS_ENTITY_AUDIT_EVENTS Namespace GUID: f4658406-3a4b-4076-afb0-6e74745934b6 URI: ATLAS_ENTITY_AUDIT_EVENTS Classifications Managed System Propagated Terms + Add Classification Schema Policy Access Audits **Timeline** Wed Apr 07 2021 10:50:48 GMT+0530 (India Standard Time) atlas

Clicking on a user in the Timeline format displays the JSON data, which is again derived from Atlas.

Managing Profilers

Kubernetes enables profiler job scheduling and runs profiler jobs on-demand and on schedule.

A service called Profiler Launcher Service (PLS) is made available to launch the Data Catalog profiler. The PLS is deployed in the Control Plane during the stack installation and the Management Console application (DC-API) makes an HTTP call to schedule the jobs. PLS is authorized to schedule and run Kubernetes jobs in the targeted cluster. You must install a PLS service in each Kubernetes / OCP cluster and a single control plane application to manage all the profiler jobs.

Note: You must be a **PowerUser** to launch the Profiler.

Table 1: List of built-in profilers

Profiler Name	Description
Cluster Sensitivity Profiler	A sensitive data profiler- PII, PCI, HIPAA, etc.
Ranger Audit Profiler	A Ranger audit log summarizer.
Hive Column Profiler	Provides summary statistics like Maximum, Minimum, Mean, Unique, and Null values at the Hive column level.

Scheduling Profiler jobs on your Private Cloud cluster

You must schedule the profilers to view the profiler results for your assets and datasets. You must be a **PowerUser** to schedule these jobs.

Profiler launcher service is installed at the setting up of the cluster. Later, you can schedule or run jobs on demand from the Data Catalog UI.

You must first note the following scenarios when working with profilers:

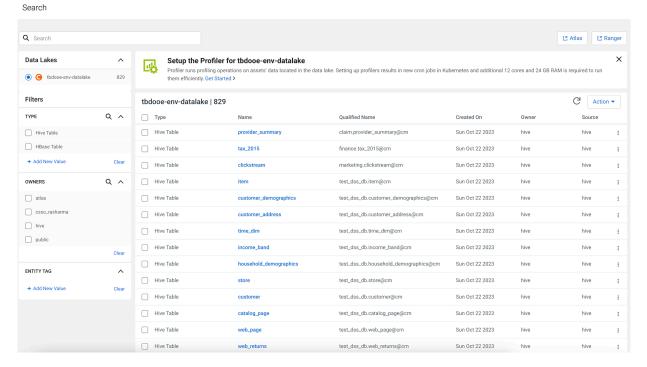

- Your profiler is not launched for the selected data lake
- Your profiler is already launched for the selected data lake.

If your profiler is not launched for the selected data lake, follow these steps:

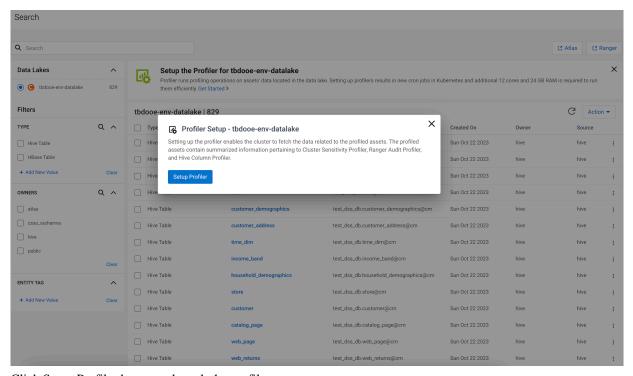

1. From the Search menu > select the data lake for which you want to profile the data.

The setup profiler page is displayed for the data lake.

2. Click the Get Started link.

The Profiler setup for the data lake window appears.

3. Click Setup Profiler button to launch the profiler

The High Availability (HA) feature for profilers, including launching and managing jobs are supported by default. No separate action is required to enable the HA functionality or its components.

Note: Once you schedule the profiler jobs, navigate to the Profilers page to view the status of the respective profiler jobs.

Launching profilers using Command-line

Data Catalog now supports launching Data profilers using the Command-Line Interface (CLI) option.

This, apart from launching the profilers using the Data Catalog UI. The CLI will be one executable and will not have any external dependencies. You can execute some operations in the Data Catalog service using the CDP CLI commands.

Users must have valid permission(s) to launch profilers on a data lake.

For more information about the access details, see Prerequisites to access Data Catalog service.

You must have the following entitlement granted to use this feature:

DATA_CATALOG_ENABLE_API_SERVICE

In your CDP CLI environment, enter the following command to get started in the CLI mode.

cdp datacatalog --help

This command provides information about the available commands in Data Catalog.

The output is displayed as:

NAME

datacatalog

DESCRIPTION

Cloudera Data Catalog Service is a web service, using this service user can execute operations like launching profilers in Data Catalog.

AVAILABLE SUBCOMMANDS

launch-profilers

You get additional information about this command by using:

cdp datacatalog launch-profilers --help

NAME

launch-profilers -

DESCRIPTION

Launches DataCatalog profilers in a given datalake.

SYNOPSIS

launch-profilers

--datalake <value>

[--cli-input-json <value>]

[--generate-cli-skeleton]

OPTIONS

--datalake (string) The Name or CRN of the Datalake.

--cli-input-json (string) Performs service operation based on the JSON string provided. The JSON string follows the format provided by --generate-cli-s

keleton. If other arguments are provided on the command line, the CLI values will override the JSON-provided values.

--generate-cli-skeleton (boolean) Prints a sample input JSON to standard out put. Note the specified operation is not run if this argument is specified. The sample input can be used as an argument for --cli-input-json.

OUTPUT

datahubCluster -> (object)

Information about a cluster.

clusterName -> (string)

The name of the cluster.

crn -> (string)

The CRN of the cluster.

creationDate -> (datetime)

The date when the cluster was created.

clusterStatus -> (string)

The status of the cluster.

nodeCount -> (integer)

The cluster node count.

workloadType -> (string)

The workload type for the cluster.

cloudPlatform -> (string)

The cloud platform.

imageDetails -> (object)

The details of the image used for cluster instances.

name -> (string)

The name of the image used for cluster instances.

id -> (string)

The ID of the image used for cluster instances.

This is internally generated by the cloud provider to Uniquely identify the image.

catalogUrl -> (string)

The image catalog URL.

```
catalogName -> (string)
The image catalog name.
environmentCrn -> (string)
The CRN of the environment.
credentialCrn -> (string)
The CRN of the credential.
datalakeCrn -> (string)
The CRN of the attached datalake.
clusterTemplateCrn -> (string)
 The CRN of the cluster template used for the cluster
creation.
You can use the following CLI command to launch the Data profiler:
cdp datacatalog launch-profilers --datalake <datalake name or datalake CRN>
Example
cdp datacatalog launch-profilers --datalake test-env-ycloud
"datahubCluster": {
"clusterName": "cdp-dc-profilers-24835599",
          "crn":
              "crn:cdp:datahub:us-west-1:9d74eee4-1cad-45d7-b645-7ccf9edbb73d:
 cluster:dfaa7646-d77f-4099-a3ac-6628e1576160",
"creationDate": "2021-06-04T11:31:23.735000+00:00",
"clusterStatus": "REQUESTED",
"nodeCount": 3,
"workloadType": "v6-cdp-datacatalog-profiler_7_2_8-1",
"cloudPlatform": "YARN",
"imageDetails": {
              "docker-sandbox.infra.cloudera.com/cloudbreak/centos-76:2020-05
 -18-17-16-16",
"id": "d558405b-b8ba-4425-94cc-a8baff9ffb2c",
               "catalogUrl":
              "https://cloudbreak-imagecatalog.s3.amazonaws.com/v3-test-cb-imag
 e-catalog.json",
"catalogName": "cdp-default"
```

Deleting profilers

Deleting profiler container (pod) jobs removes all the Custom Sensitivity Profiler rules and other updates to the specified profiler.

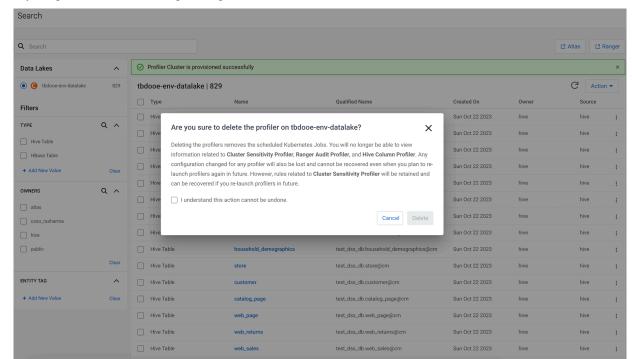

About this task

To overcome this situation, when you decide to delete the profiler cluster, there is a provision to retain the status of the Custom Sensitivity Profiler rules. If your profiler cluster has rules that are not changed or updated, you can directly delete the profiler cluster. If the rules were modified or updated, you have an option to download the modified rules along with deletion. The modified rules consist of the suspended System rules and the deployed Custom rules. Using the downloaded rules, you can manually add or modify them to your newly added profiler cluster.

- When you delete the scheduled jobs, the associated Kubernetes cron job object is deleted from the Kubernetes cluster.
- The associated data of the profilers from the Management Console database is also deleted for the specified data lake.

Procedure

- 1. On the search page, select the Data Lake from the list.
- 2. Click the Actions drop-down menu and select Delete Cluster.
- 3. Click Yes to proceed.

4. If you agree, select the warning message I understand this action cannot be undone.

5. Click Delete.

The application displays the following message.

The profiler cluster is deleted successfully.

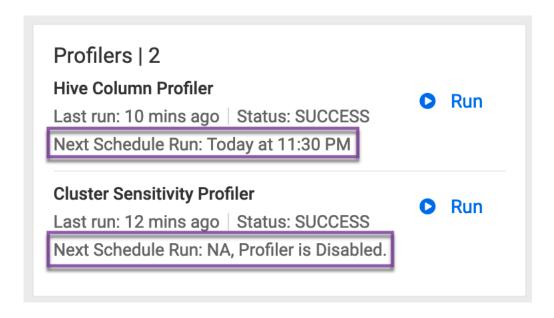

On-Demand Profilers

You can use on-demand profilers to profile specific assets without depending on the cron-based scheduling of profilers jobs. On-demand profiler option is available on the asset details page of the selected asset.

For example, the diagram displays the Asset Details page of an asset. Run On-Demand profiler for Hive Column Statistics and Custom Sensitivity Profiler by clicking on the appropriate Run button. The next scheduled run provides details about the next scheduled profiling for the respective profilers.

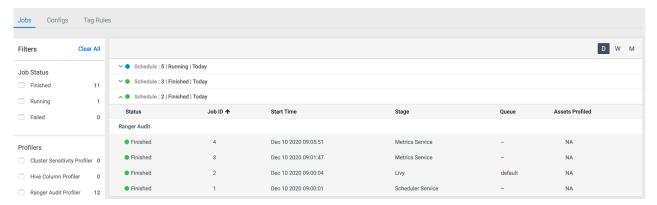

Note: You can use the On-Demand Profiler feature to profile both External and Managed tables.

Tracking Profiler Jobs

The Data Catalog profiler page is updated to provide a better user experience for tracking respective profiler jobs.

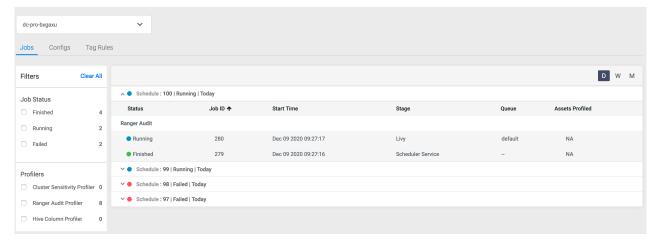

A new placeholder named "Schedule" is introduced under the Profilers section to provide tracking information of each profiler job. Under Schedule, you can find the type of profiler job that has run or in progress or has completed profiling data assets.

For each profiler job, you can view the details about:

- Job Status
- Type
- Job ID
- Start Time
- Stage
- Job Queue
- Total assets profiled

Data Catalog / Profilers

Using this data can help you to troubleshoot failed jobs or even understand how the jobs were profiled and other pertinent information that can help you to manage your profiled assets. Whenever the Schedule status appears in green, it indicates that the profiler job has run successfully. When the color appears in blue and red, it indicates that the profiler job is running or has failed.

Profiler job runs in three phases:

- Scheduler Service Part of Profiler Admin which queues the profiler requests.
- Livy This service is managed by YARN and where the actual asset profiling takes place.
- Metrics Service Reads the profiled data files and publishes them.

Note: More than one occurrence of Scheduler Service or Livy indicates that there could be more assets to be profiled. For example, if a HBase schedule has about 80 assets to be profiled, the first 50 assets would be profiled in the first Livy batch and the other assets get profiled in the next batch.

Clicking on each profiled asset would navigate to the profiled asset details page. The asset profiled page provides information about the profiled asset, profiled status, the profiled job id, and other relevant details.

In case of Ranger Audit profiling, there could be a "NA" status for the total number of assets profiled. It indicates that the auditing that happens is dependent on the Ranger policies. In other words, the Ranger policies are actually profiled and not the assets.

Important: Currently, the On-Demand schedule is not supported for this version of the profiler. The job schedule is either grayed out or disabled in such a scenario.

Viewing Profiler Jobs

You can monitor the overall health of your profiler jobs by viewing their status on the Profiler Jobs .

Each profiler runs a Spark job on a user-defined schedule defined via the profiler configuration. You can view the status of each of those jobs for all your clusters.

Monitoring the profiler jobs has the following uses:

- By seeing long-term trends in job execution, you can determine the overall health of your profilers.
- Knowing when jobs first failed can help when troubleshooting problems with profilers.

You can take the following actions:

- 1. Filter by job status or profiler.
- 2. Sort by start time.
- 3. Click to show a day, week, or month of jobs.
- **4.** Sort by jobs ID, status, start time, cluster, queue, or profilers.

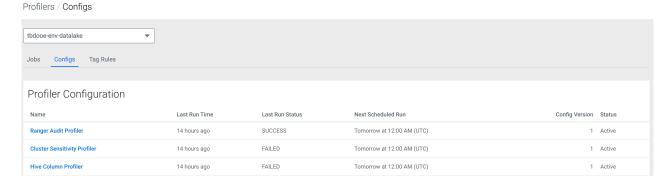

5. Expand or narrow to show a day, week, or month of jobs.

About the Data Catalog Profiler Understanding the sensitive data profiler Understanding the ranger audit profiler

Viewing Profiler Configurations

You can monitor the overall health of individual profilers by viewing their status on Profiler Configs .

Monitoring the profiler configurations has the following uses:

- Verify which profilers are active and inactive.
- Verify the status of the profiler runs.
- View the last run time and status and the next scheduled run.

Additional Configuration for Ranger Audit Profiler

In addition to the generic configuration, there are additional parameters for the Ranger Audit Profiler that can optionally be edited.

Procedure

- 1. Click Profilers in the main navigation menu on the left..
- 2. Click Configs to view all of the configured profilers.

3. Select Ranger Audit Profiler for which you need to edit the profiler configuration.

You can use the toggle button

to enable / disable the Ranger Audit Profiler.

The Ranger Audit Profiler detail page is displayed which contains the following sections:

- Profiler Configurations
- Executor Configurations

Profiler Configurations

- Sampling configurations enables you to regulate sampling behaviour of the profilers. When an asset/table is profiled, instead of scanning the whole table, the profiler sample selects records as it finds them.
- Sample Count: Indicates the number of times a table must be sampled for profiling. A value less than 3 and higher than 30 is not recommended.
- Sample Factor: Controls the randomisation of records. Less value promote better random samples and higher values results in poor samples. A value 0.001 indicates that the data that is retrieved from Hive and a new random number is generated. If the value is less than or equal to the provided proportion (0.001), it will be chosen in the result set. If the value is greater, it is ignored.
- Sample Records: Indicates the number of records to be retrieved in a given sample. Consider this as LIMIT clause of the SQL query.

Executor Configurations

Executor Configurations are the runtime configuration. These configuration must be changed if you are changing the Pod configurations and when there is a requirement for additional compute power.

- Number of workers: Indicates the number of processes that are used by the distributed computing framework.
- · Number of threads per worker: Indicates the number of threads used by each worker to complete the job.
- Worker Memory limit in GB: To avoid over utilization of memory, this parameter forces an upper threshold memory usage for a given worker. For example, if you have a 8 GB Pod and 4 threads, the value of this parameter must be 2 GB.

Additional Configuration for Hive Column Profiler

In addition to the generic configuration, there are additional parameters for the Hive Column Profiler that can optionally be edited.

Procedure

- 1. Click Profilers in the main navigation menu on the left.
- 2. Click Configs to view all of the configured profilers.
- 3. Select the cluster for which you need to edit profiler configuration.

The list of profilers for the selected clusters is displayed.

4. Select the cluster for which you need to edit profiler configuration.

You can use the toggle button

to enable / disable the Hive Column Profiler.

The Hive Column Profiler detail page is displayed which contains the following sections:

- Profiler Configurations
- Pod Configurations
- Executor Configurations
- Asset Filter Rules

Profiler Configurations

- Sampling or Profiler configurations enables you to regulate sampling behaviour of the profilers. When an asset/table is profiled, instead of scanning the whole table, the profiler sample selects records as it finds them.
- Sample Count: Indicates the number of times a table must be sampled for profiling. A value less than 3 and higher than 30 is not recommended.
- Sample Factor: Controls the randomisation of records. Less value promote better random samples and higher values results in poor samples. A value 0.001 indicates that the data that is retrieved from Hive and a new random number is generated. If the value is less than or equal to the provided proportion (0.001), it will be chosen in the result set. If the value is greater, it is ignored.
- Sample Records: Indicates the number of records to be retrieved in a given sample. Consider this as LIMIT clause of the SQL query.

Profiler Configurations

As all profilers are submitted as Kubernetes jobs, you must decide if you want to add or reduce resources to handle workload of various sizes.

Pod configurations specify the resources that would be allocated to a pod when the profiler job starts to run.

- Pod CPU limit: Indicates the maximum number of cores that can be allocated to a Pod. The accepted values examples are 0.5, 1, 2, 500m, and 250m.
- Pod CPU Requirements: This is the minimum number of CPUs that will be allocated to a Pod when its provisioned. If the node where a Pod is running has enough resources available, it is possible (and allowed) for a container to use more resource than its request for that resource specifies. However, a container is not allowed to use more than its resource limit. The accepted values examples are 0.5, 1, 2, 500m, and 250m.
- Pod Memory limit: Maximum amount of memory can be allocated to a Pod. The accepted values examples are: 128974848, 129e6, 129M, 128974848000m, and 123Mi.
- Pod Memory Requirements: This is the minimum amount of RAM that will be allocated to a Pod when it is
 provisioned. If the node where a Pod is running has enough resources available, it is possible (and allowed)
 for a container to use more resource than its request for that resource specifies. However, a container is not
 allowed to use more than its resource limit.

Executor Configurations

Executor Configurations are the runtime configuration. These configuration must be changed if you are changing the Pod configurations and when there is a requirement for additional compute power.

- Number of workers: Indicates the number of processes that are used by the distributed computing framework.
- Number of threads per worker: Indicates the number of threads used by each worker to complete the job.
- Worker Memory limit in GB: To avoid over utilization of memory, this parameter forces an upper threshold memory usage for a given worker. For example, if you have a 8 GB Pod and 4 threads, the value of this parameter must be 2 GB.

Additional Configuration for Cluster Sensitivity Profiler

In addition to the generic configuration, there are additional parameters for the Cluster Sensitivity Profiler that can optionally be edited.

Procedure

- 1. Click Profilers in the main navigation menu on the left.
- 2. Click Configs to view all of the configured profilers.
- 3. Select Cluster Sensitivity Profiler for which you need to edit the profiler configuration.

You can use the toggle button

to enable / disable the Cluster Sensitivity Profiler.

The Cluster Sensitivity Profiler detail page is displayed which contains the following sections:

- Profiler Configurations
- Pod Configurations
- · Executor Configurations
- Asset Filter Rules

Profiler Configurations

- Sampling configurations enables you to regulate sampling behaviour of the profilers. When an asset/table is profiled, instead of scanning the whole table, the profiler sample selects records as it finds them.
- Sample Count: Indicates the number of times a table must be sampled for profiling. A value less than 3 and higher than 30 is not recommended.
- Sample Factor: Controls the randomisation of records. Less value promote better random samples and higher values results in poor samples. A value 0.001 indicates that the data that is retrieved from Hive and a new random number is generated. If the value is less than or equal to the provided proportion (0.001), it will be chosen in the result set. If the value is greater, it is ignored.
- Sample Records: Indicates the number of records to be retrieved in a given sample. Consider this as LIMIT clause of the SQL query.

Pod Configurations

As all profilers are submitted as Kubernetes jobs, you must decide if you want to add or reduce resources to handle workload of various sizes.

Related Information

About the Data Catalog Profiler Understanding the sensitive data profiler

Understanding Cron Expression generator

A cron expression details about when the schedule executes and visualizes the next execution dates of your cron expression. The cron expression utilizes the quartz engine.

The cron expression uses a typical format:

Each * in the cron represents a unique value.

```
Cron Expression: 0 18 * **

Represented by Minute hour day(month) month day(week)

As an example,

"At 10:30 on day-of-month 15 in May."

30 10 15 5 *

Consider another use case example:

"At 10:30 on Sunday in May."

30 10 * 5 7
```

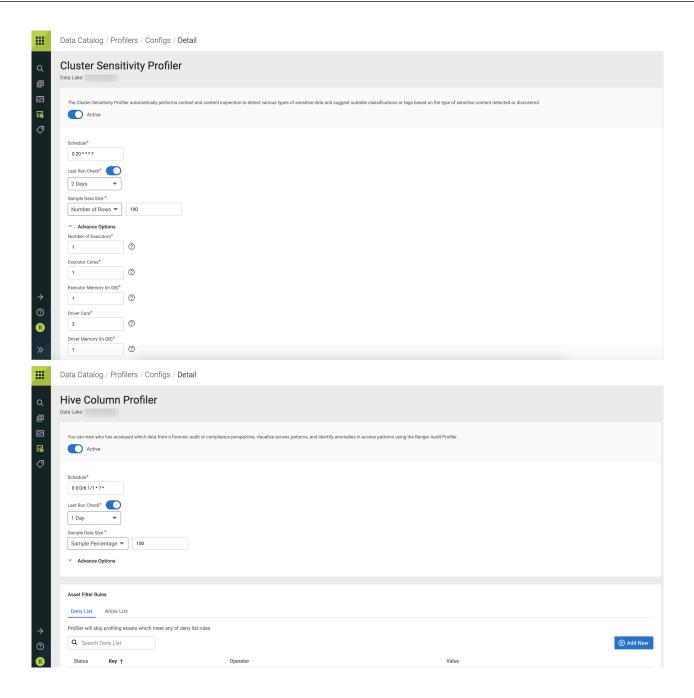

You can change the value of cron as and when it is required depending on how you want to schedule your profiler job.

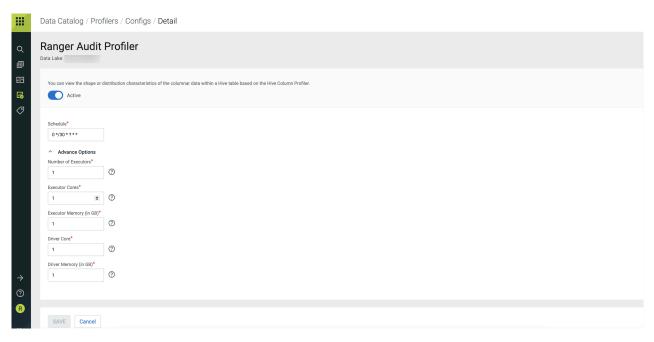

Setting Asset filter rules

Add Asset filter rules as needed to customize the selection and deselection of assets which the profiler profiles.

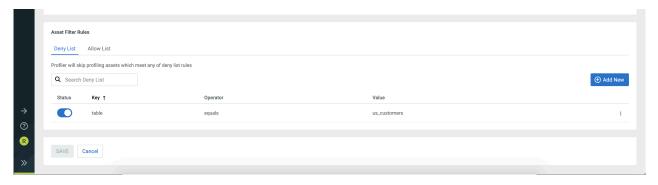

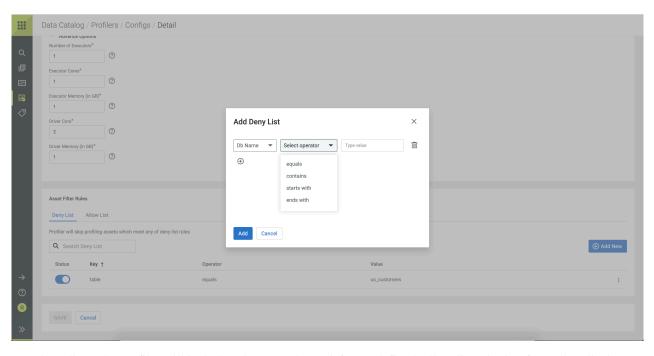

Note: You can configure the Deny-list and Allow-list for both Cluster Sensitivity Profiler and Hive Column Profiler. The same filter rules do not apply to Ranger Audit Profiler.

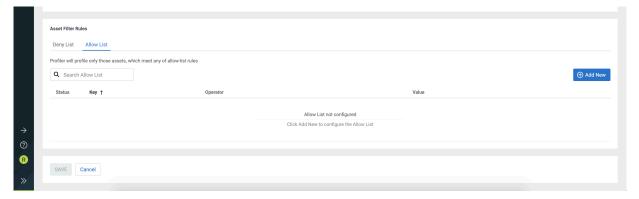

- Deny-list The profiler will skip profiling assets that meet any defined Deny-list criteria.
 - Select the Deny-list tab.
 - Click Add New to include rules for Deny-list.
 - Select the key from the drop down list. You can select a database name, name of the asset, name of the owner of the asset, path to the assets, or created date.
 - Select the operator from the drop down list. Depending on the keys selected, you can select an operator such as equals, contains. For example, you can select the name of assets that contain a particular string.
 - Enter the value corresponding to the key. For example, you can enter a string as mentioned in the previous example here.
 - Click Done. Once it is added, you can toggle the state of the new rule to enable it or disable it as needed.

- Allow-list The profiler will include only assets that satisfy any defined Allow-list criteria. If no Allow-list is defined, the profiler will profile all the assets.
 - Select the Allow-list tab.
 - Click Add New to include rules for the Allow-list.
 - Select the key from the drop down list. You can select a database name, name of the asset, name of the owner of the asset, path to the assets, or created date.
 - Select the operator from the drop down list. Depending on the keys selected, you can select an operator such as equals, contains. For example, you can select the name of assets that contain a particular string.
 - Enter the value corresponding to the key. For example, you can enter a string as mentioned in the previous example.
 - Click Done. Once it is added, you can toggle the state of the new rule to enable or disable it as needed.

Note: If an asset meets both Allow-list and Deny-list rules, the Deny-list rule overrides the Allow-list.

Enable or Disable Profilers

By default profilers are scheduled to run at every 24 hours at midnight UTC timezone.

Procedure

- 1. From Profiler Configs
- **2.** Select the profiler to proceed further.

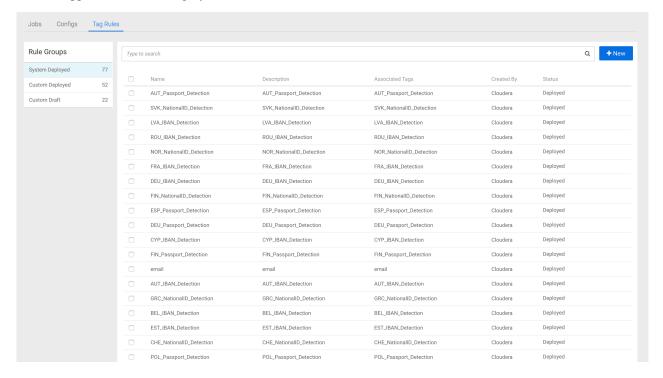

Profiler Tag Rules

You can use preconfigured tag rules or create new rules based on regular expressions and allow or deny files on specific columns in your tables.

Rules are categorized into three groups:

- System Deployed: These are in-built rules that cannot be edited.
- Custom Deployed: Tag rules that you create and deploy on clusters after validation will appear under this
 category. Hover your mouse over the tag rules to deploy or suspend them as needed. You can also edit these tag
 rules
- Custom Draft: You can create new tag rules and save them for later validation and deployment on clusters. Such rules appear under this category.

Tag Management

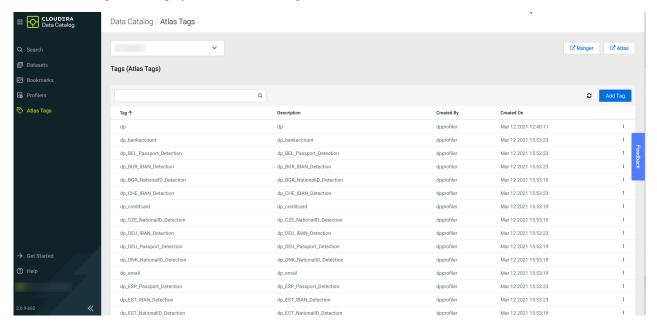

From Atlas tags UI in Data Catalog, you can create, modify, and delete any of the Atlas tags in a Data Catalog instance.

You can access the Atlas link by logging into Data Catalog > Atlas Tags.

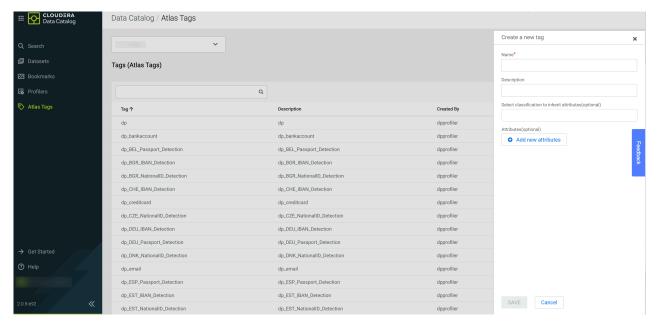

Atlas Tags allows the user to perform the following activities with a selected Data Lake for tag management:

- Selecting a Data Lake
- · Searching for a tag
- · Adding a tag
- · Editing a tag
- · Deleting a tag

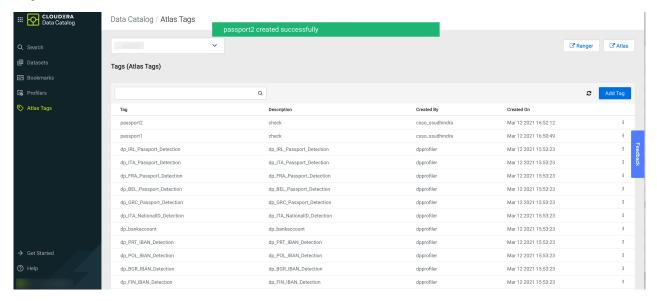

The new Atlas tags UI is displayed as seen in the diagram.

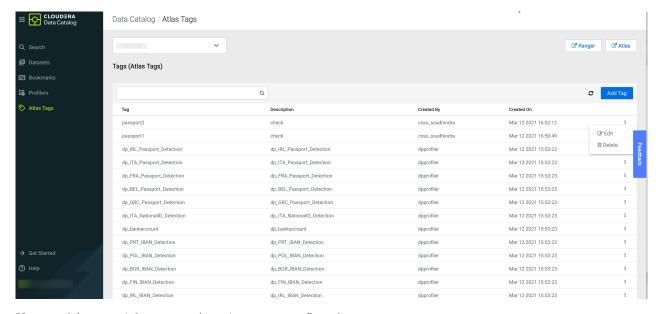

You can create a new tag in the Atlas tags UI. The following diagram provides an overview about the Create a new tag page.

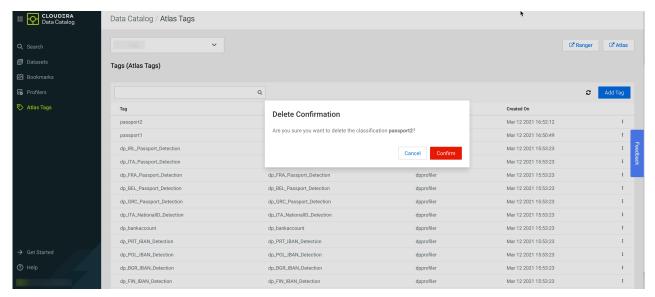

You can add or update Atlas tags. The created or updated tag is highlighted in the tag list as seen in the following diagram.

You can also edit or delete the Atlas tag as shown in the image. When you are editing the tag, you can only change the description or add new attributes.

You can delete one Atlas tag at a time. A separate confirmation message appears.

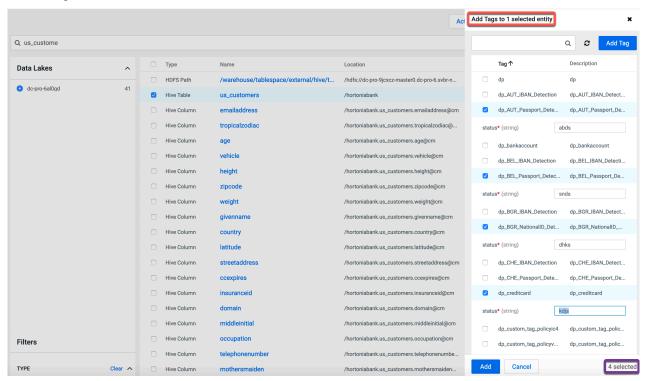

Tagging Multiple Assets

On the Data Catalog search page, you can add tags to multiple assets based on the asset type that you select based on the search result.

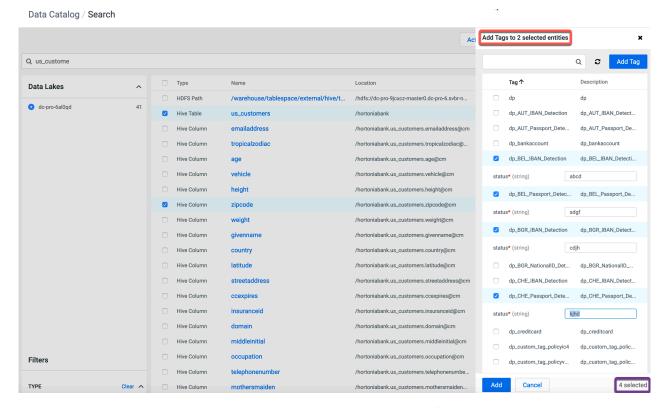

When you select an asset, you can add one or more available tags to the selected asset. You can also create one or more new tags and associate the newly created tags to the selected asset. The number of selected assets that you plan to tag is displayed. As you add the number of tags to one or more selected assets, The Add Tag panel displays the number of tags assigned.

Data Catalog / Search

Note: If you do not save your changes without clicking the Add button in Add Tags panel, the changes are not retained in the Data Catalog instance. You have to retag the assets and later click the Add button.

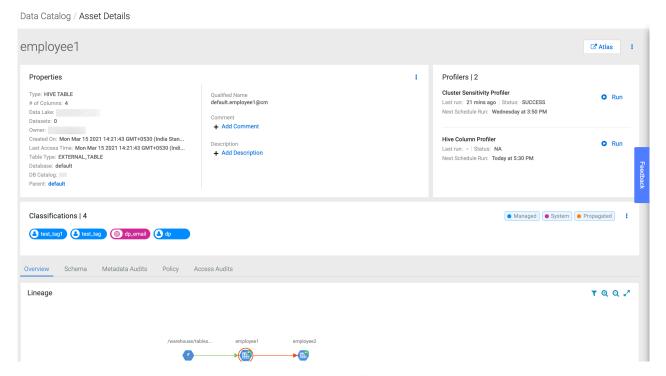

When you add one or more tags to the selected entities, the assigned tags are displayed having been tagged to the number of selected entities. Another scenario could throw a message saying that the selected asset is already tagged.

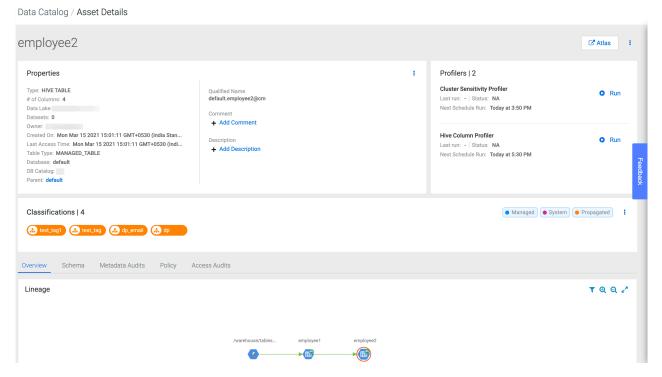

Propagated Asset tagging

Data Catalog supports the concept of propagated tags. This feature is derived from Apache Atlas.

Whenever you add a new tag, you can mark them as propagated and use those tags accordingly while tagging assets.

For example, consider table 1 as a parent asset and table 2 as a child asset. Create a tag and mark that tag as propagated, and later apply the same tag to table 1. The tag gets applied to table 2 as well. Propagated tag works on the basis of parent -> child tagging relationship.

Note: When you delete or remove the propagated tag from the parent asset, the same tag is removed from all the child assets.

Attention: The propagated tag concept is not supported with child -> parent relationships.

Creating Custom Profiler Rules

You can create a custom profiler by adding the required tags, regex entries, and attaching whitelist or blacklist files to specific columns within your tables.

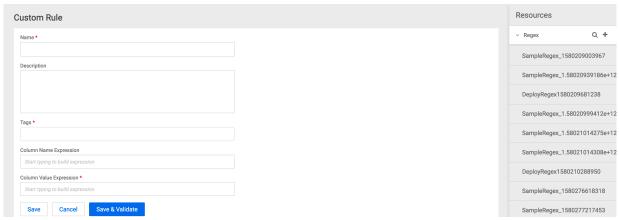

Procedure

- 1. On the Profilers page, click Tag Rules.
- 2. On the Tag Rules tab, click New to create a new profiler tag rule.
- **3.** Enter the name of the new custom profiler tag rule.
- **4.** Enter the description for the custom tag rule.
- 5. Select the Tags. You can select tags from the drop down list and or enter a new value to create a new tag. New tags that you create here are added with a dp_ prefix in the list of Atlas tags. For example, if you add a new tag called credit_card, this tag will be added as dp_credit_card in Atlas.
- **6.** Enter the rule for the column name. As you enter the values, regex name and resource names are auto populated. Select the column that is needed for your custom profiler.
- 7. Enter the column value for the DSL.

Based on your entry, Data Catalog auto populates values from the entries already available in the Resources tab. You can use a combination of regex entries and whitelist or blacklist files and other behaviors. For more information about behaviors, see DSL Grammar.

8. Click Save and Validate.

Data Catalog / Profilers

In the validation pop up window that appears, enter data to validate your custom profiler tag rule. Make sure you separate each data entry with a new line.

9. Click Save to create a tag rule and validate and deploy it later.

Adding Custom Regular Expressions

To use custom regex entries within your new custom profiler tag rules, you can also add new regex values.

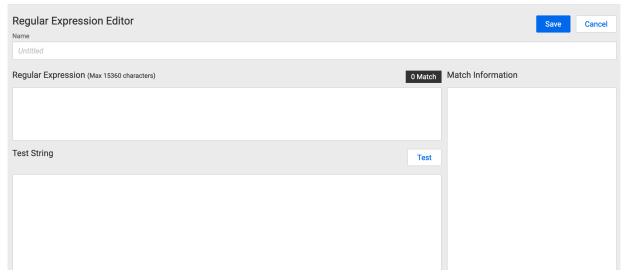

Procedure

1. Click Resources in the right panel on the New Custom Profiler Rules page.

- 2. Click + icon on the Regex tab. The Regular Expression Editor page appears.
- 3. Enter the name of the new regular expression.
- 4. Enter a valid regular expression.

For example:

$$\begin{array}{l} \b(([a-zA-Z0-9_{-}.]+)@((\[[0-9]\{1,3\}\.[0-9]\{1,3\}\.[0-9]\{1,3\}\.))|(([a-zA-Z0-9]-]+\.)+))([a-zA-Z]\{2,4\}|[0-9]\{1,3\})()) \\ \begin{tabular}{l} \begin{tabular}{l}$$

- **5.** Enter the list of test strings to evaluate the new regular expression.

 If the test string is valid, then the match information gets auto populated in the Match Information box.
- 6. Click Save to add the new regular expression to the list of Regex Resources.

Adding Lookup Files

When you have too many allowed and denied entries and cannot add them inline, you can create allowed or denied files with one value in each line and add them to your DSL.

Procedure

- 1. Click Resources in the right panel on the New Custom Profiler Rules page.
- 2. Click + icon on the Lookups tab. The New Lookup File page appears.
- 3. Enter the name of the new Lookup file.
- 4. Click Choose File to upload the file.
- 5. Click Save.

Using Behaviors

You can use various behaviors to take single inputs of type text and evaluate them to a Boolean value.

The profiler can take column values of any type and pass the values to each behaviour as text. Behaviors include the following:

- 1. Regular expressions
- 2. File based allowlist and denylist checks

Regular expressions

You can include one or more regular expressions and evaluate to True if one of these matches the provided value.

Keyword: regex

A regex that matches everything can be defined as follows:

```
regex(\"[\\\s\\\\S]+\")
```

A regex that includes multiple expressions can be defined as follows:

```
regex(\"[\\\s\\\S]+\",\"^[0-9]*$\")
```

Using DSL Grammar

Using DSL grammar, you can combine different behaviours in intuitive ways to bring out functionality while creating custom profiler rules.

The two behaviors available in this framework are as follows:

- 1. falseIdentity Always evaluates to false, regardless of the input.
- 2. trueIdentity Always evaluates to true, regardless of the input.

These two behaviors are used in the following examples and descriptions.

Binary AND operator

Keyword: and

And works the same way it does other languages. Hence following observations.

```
falseIdentity and trueIdentity == falseIdentity

falseIdentity and falseIdentity == falseIdentity

trueIdentity and trueIdentity == trueIdentity

trueIdentity and falseIdentity == falseIdentity
```

Here we are using == to show their equality.

Binary OR operator

The or operator works the same way it does in other languages.

```
falseIdentity or trueIdentity == trueIdentity

falseIdentity or falseIdentity == falseIdentity

trueIdentity or trueIdentity == trueIdentity

trueIdentity or falseIdentity == trueIdentity
```

Expand DSL to use as follows.

```
val rule1= falseIdentity and trueIdentity and trueIdentity

val rule2= trueIdentity and trueIdentity and trueIdentity

val rule3=rule1 and rule2

rule3 or trueIdentity
```

The above expression evaluates to true.
