How to Enable Unauthenticated Access

Before invoking the CDP Data Visualization Data API, you must first enable it in the configuration file of the Web Server, and obtain an API key.

You might have to enable “Enable Unauthenticated Access” for the application if you are attempting to access the API outside of CML or CDSW jobs or sessions.

See the “Public Applications” section of <https://docs.cloudera.com/machine-learning/1.4.1/applications/topics/ml-securing-applications.html> Securing Applications

Enabling Data APIs

To enable CDP Data Visualization Data API, update the configuration settings, and restart the CDP Data Visualization instance.

About this task

Note: This is only possible for CDP Data Visualization instance running in CML and CDSW

Procedure

1. Navigate to the Site Settings from the navigation menu and Advanced Site Settings section at the bottom of the page.
2. Add the ENABLE_API_KEYS and DATA_API_ENABLED settings in the configuration file of the Arcadia Web Server:

```
ENABLE_API_KEYS = True # If you plan to access via API keys
DATA_API_ENABLED = True
```

3. Restart the CDP Data Visualization service.

Using API keys

When you do not login directly into the visual layer of CDP Data Visualization, you must obtain an API key and implement it when using Data APIs.

Before you begin

Follow the instructions shown in [Creating new API keys](#).

Procedure

1. After obtaining an API Key, you can use it to authenticate the user to access the dataset, and invoke the data layer of CDP Data Visualization at the following endpoint:

```
http(s)://server:port/arc/api/data
```

2. Proceed with using the Data API interface.
For more information, see [Example of Data API usage](#).

Related Information

Accessing Data API request payload

To avoid creating Data API requests from scratch, CDP Data Visualization provides access to details of the data requests.

About this task

This task is optional.

Procedure

1. Add the following settings in Advanced Site Settings section of the Site Settings page:

```
ENABLE_DSREQ_PERF_DISPLAY = True
COMPRESS_DSREQ = True
```

2. Restart the CDP Data Visualization service.
3. Open an existing dashboard.
In this example, we selected Cereals.
4. Use the keyboard shortcut **Shift + Control/Cmd + G** to open the Performance Profile interface.

5. Hover over a line that represents a visual ID, we selected 75, and view the duration, type, and details of the query that runs against that visual.

The query uses the same API and includes the details of the data requests. You can use this dataset request as the payload for your Data API call.

The screenshot shows the 'Profile Data' interface with a 'QUERY EXECUTION BY VISUAL ID' chart. A tooltip for visual ID 75 displays the following JSON dataset request:

```

{
  "version": 1,
  "highlighting": false,
  "type": "SQL",
  "limit": 5000,
  "dimensions": [
    {
      "type": "SIMPLE",
      "expr": "[cereal_name] as 'cereal_name'"
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([calories]) as 'Calories'",
      "order": {
        "asc": false,
        "pri": 1
      }
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([complex_carbohydrates_grams]) as 'Carbohydrates'",
      "order": {
        "asc": false,
        "pri": 1
      }
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([fat_grams]) as 'Fat'",
      "order": {
        "asc": false,
        "pri": 1
      }
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([dietary_fiber_grams]) as 'Fiber'",
      "order": {
        "asc": false,
        "pri": 1
      }
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([potassium_mg]) as 'Potassium'",
      "order": {
        "asc": false,
        "pri": 1
      }
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([protein_grams]) as 'Protein'",
      "order": {
        "asc": false,
        "pri": 1
      }
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([sodium_mg]) as 'Sodium'",
      "order": {
        "asc": false,
        "pri": 1
      }
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([sugars_grams]) as 'Sugar'",
      "order": {
        "asc": false,
        "pri": 1
      }
    },
    {
      "type": "AGGREGATE",
      "expr": "sum([vitamins_and_minerals]) as 'Vitamins/Minerals'",
      "order": {
        "asc": false,
        "pri": 1
      }
    }
  ],
  "ksqlStreamPosition": "",
  "dataset_id": 11
}
    
```

The 'QUERY DETAIL' table below shows the execution timeline for visual ID 75:

Time	ID	Type	Duration (seconds)
2022-11-10T11:42:52.681Z	0	startup	
2022-11-10T11:42:53.116Z	0	staticfetch	0.17
2022-11-10T11:42:53.119Z	0	staticfetch	0.17
2022-11-10T11:42:53.131Z	0	staticfetch	0.18
2022-11-10T11:42:53.524Z	0	QueryRun	0.53
2022-11-10T11:42:53.524Z	75	Query	0.41

Migrating visual artifacts with REST APIs

In addition to UI-enabled export and import, CDP Data Visualization provides REST APIs that give more flexibility in choosing what objects to migrate. While migrating artifacts using the UI allows you to directly specify export of visuals, dashboards, and apps, REST APIs enable you to specify a wider range of migratable objects.

About this task

Note: You do not migrate events and segments separately, but as part of dataset migration. Similarly, you do not migrate thumbnails along with dashboards or visuals that they represent.

Before you begin

Enable and create the relevant data API keys, both for the source and destination machines. For instructions, see *Enabling API keys* and *Creating new API keys*. The examples used in these instructions use the secret API key that appears when you generate the keys for the first time, as in *Creating new API keys*.

Procedure

1. Export the objects by submitting a GET request on the source machine. For instructions, see *Exporting visual artifacts with REST APIs*.
2. Import the objects by submitting a POST request on the target machine. For instructions, see *Importing visual artifacts with REST APIs*.

Related Information

[Enabling API keys](#)

[Creating new API keys](#)

Exporting visual artifacts with REST APIs

Procedure

1. Authenticate the user using the data API.
2. After authenticating, submit a GET request to the following address for a source machine: `source_arcviz_ip/arc/migration/api/export/`

For instructions on import, see *Importing visual artifacts with REST APIs*.

Example

This is a sample Python code snippet for authenticating and submitting the GET request that exports dashboards with IDs 2115 and 2110, and then writing the response to the `my_app.json` file.

```
export requests
headers = {'AUTHORIZATION': 'apikey secret_api_key'}
payload = {'dashboards': '[2115, 2110]', 'filename': 'apitestmigration',
          'dry_run': 'False'}
r = requests.get('source_arcviz_ip/arc/migration/api/export/', headers=headers,
                params=payload)
with open('my_app.json', 'w') as f:
    f.write(r.text)
```

Related Information

[Importing visual artifacts with REST APIs](#)

Importing visual artifacts with REST APIs

Before you begin

Make sure that the `*.json` file with information about exported visual artifacts is on the destination machine.

Procedure

1. Authenticate the user using the data API.

2. After authenticating, submit a POST request to the following address for a destination machine:
destination_arcviz_ip/arc/migration/api/import/

For instructions on export, see *Exporting visual artifacts with REST APIs*.

Example

This is a sample Python code snippet for authenticating and submitting the POST request that imports dashboards with IDs 2115 and 2110, which were earlier saved (from a metadata perspective) as my_app.json. This file is uploaded to the Data Visualization server during the import.

```
import requests
headers = {'AUTHORIZATION': 'apikey secret_api_key'}
payload = {'dry_run': False, "dataconnection_name": "data_connection"}
files = {'import_file': open('/Users/my_name/Downloads/my_app.json', 'r')}
r = requests.post('destination_arcviz_ip/arc/migration/api/import/', files=files, data=payload, headers=headers)
print r.status_code # 200 is success
```
