Resource Utilization Dashboard.....	4
Managing cluster resources using Quota Management.....	4

Resource Utilization Dashboard

Resource Utilization provides an overview of the resources consumed by the CDP workloads for a specific environment. You can get information about all compute clusters used across environments and compute resource utilization within these compute clusters. You can view information about the number of cores and the memory used by a specific environment. Using this data, you can plan your resource allocation for the workloads.

You can select a time range from the available options, between five minutes and 15 days, and view resource utilization data of a specific environment.

Note: When you select a time range to display that is longer than the available data, this message appears below each graph. “Note: Some data for the selected time range is missing, which may cause this graph to appear misleading. Select a shorter range.”

Resource Utilization

Managing cluster resources using Quota Management

You can use Quota Management page in the Management Console to control how cluster resources are allocated across all CDP Private Cloud Data Services.

Using Resource pools in a Data Service

Quotas are primarily setup and managed through the data services. Each data service provides its own integration. Optionally, the administrator can add pools below the "default" pool to provide an initial grouping. When creating quotas in a Data Service, you specify which base pool to use and allocate resources in.

The "default" pool is the standard node for adding services.

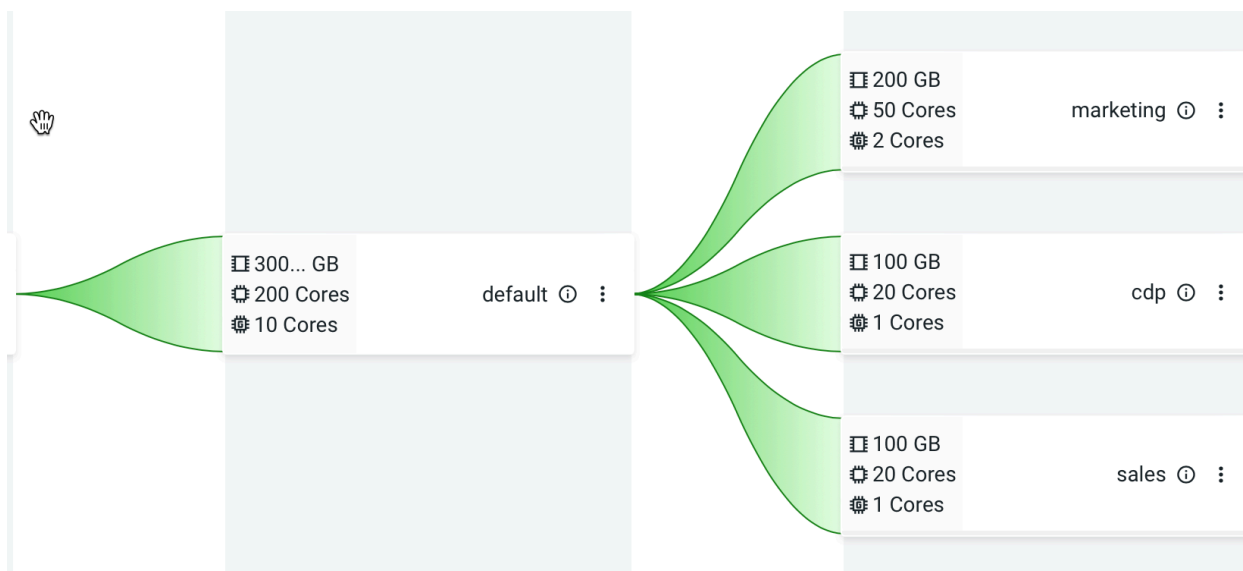

- For information about specifying pools in the Cloudera Data Engineering (CDE) service, see [Adding a Cloudera Data Engineering service](#) and [Creating virtual clusters](#).
- For information about specifying pools in the Cloudera Machine Learning (CML) service, see [Configuring Quotas](#).
- For information about specifying pools in the Cloudera Data Warehouse (CDW) service, see [Resource templates for CDW Private Cloud pods](#).

Default node setup and grouping

Quota management enables you to control how resources are allocated within your CDP Private Cloud Data Services clusters. In order to prevent a single workload from consuming all available cluster resources, you can limit the number of CPUs, GPUs, and memory allocated by application, user, business units, or Data Service by defining resource pools that define resource limits. Pools are organized in a hierarchical manner by defining nodes in the hierarchy with resource limits, which can then be subdivided as needed to allocate resources for an organization and to allocate resources to cluster-wide services such as the Control Plane. You can also use this feature to audit workload ownership and resource usage.

A system administrator defines the initial groupings, starting with the default tenant node and first creating child nodes that define quotas for CDP system resources. You will need to edit the default node settings to reflect the current total resources of your cluster.

Next the administrator creates one or more child nodes, in this example, nodes are created for the marketing and sales business units and a node is created for CDP resources.

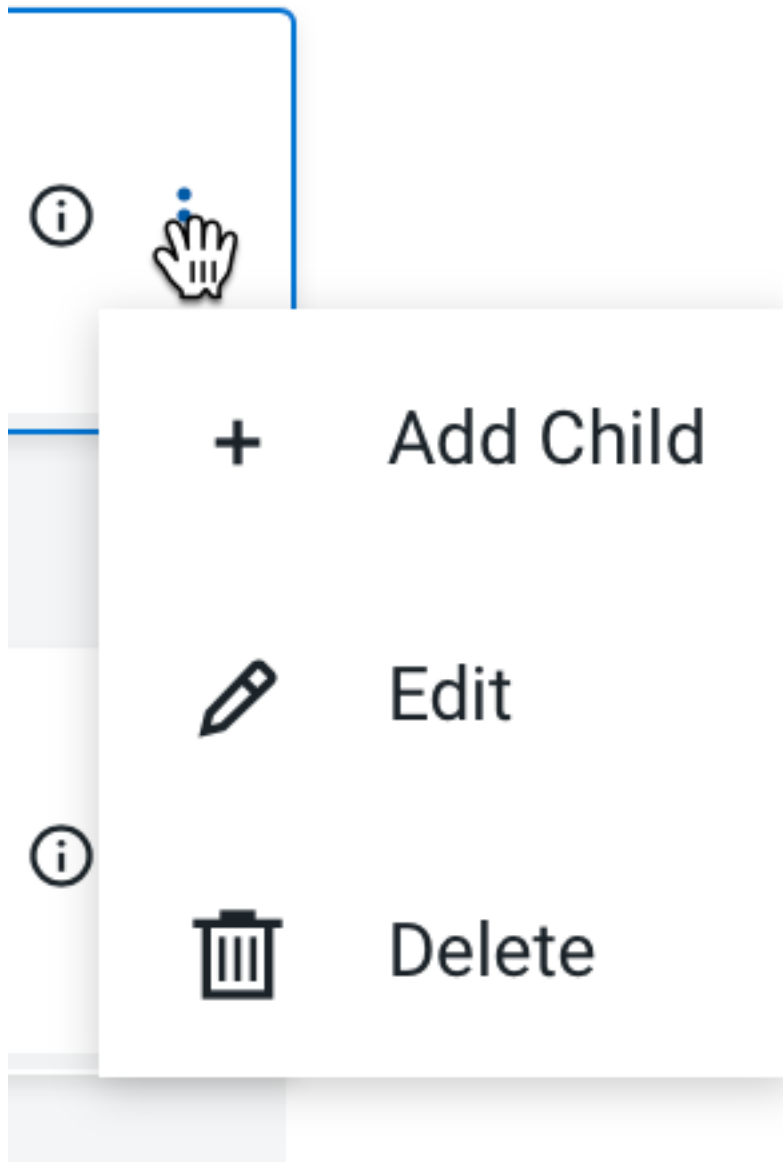

When Data Service users create new artifacts in their service’s interface they can reference a parent pool name in which to run their workload. The resources available for the workload are limited by the quotas established and consumed in the parent for pool. For example, the Parent pool, root.default.marketing refers to the “marketing” business unit pool node defined in the hierarchy.

Accessing the Quotas Page

1. Open the CDP console.
2. Go to the Management Console service.
3. Click Resource Utilization in the left navigation panel.
4. Select the Quotas tab.

Creating child nodes (resource pools),

1. Click the actions menu in a pool and select Add Child.

The Add Quota dialog box displays.

Add Quota ✕

* Name ?

✓ Total Quota

Distribution Policy ?

☒ Inelastic ☐ Elastic

Tags ?

Key	Value	

⊕ Add Tag

> Advanced

CancelOK

2. Enter the following information:

- **Name** – Enter a name for this resource pool.
- **Memory** – Use the sliders to select the memory allocation for the pool. Use the drop-down list to select the units.
- **CPU** – Use the sliders to select the CPU allocation for the pool. You can choose how CPUs are counted by selecting Cores or Millicores from the drop-down list.
- **GPU** – Use the sliders to select the GPU allocation for the pool.
- **Validity** – Enter the length of time that the pool can remain active. To keep the pool active indefinitely, enter -1.
- **Distribution policy** – The distribution type of the parent quota to the child pools (elastic or inelastic).
- **Tags** – Tags provide a way to add user-defined name/value pairs as metadata for the pools. Tags are not currently used in this release.

Note that the maximum value of the sliders is limited by the resources of the parent pool and the amount of resources not used by other pools.

Editing a resource pool

You can edit a resource pool after creating it by clicking the actions menu for the pool and selecting Edit.

Viewing details of a resource pool

You can view the resource allocations and other information by clicking the “i” icon. The namespace for the pool appears at the top:

The screenshot shows a list of three resource pools. The first pool, named 'marketing', is highlighted with a blue border. A tooltip is open for this pool, displaying its configuration and resource status. The other two pools are 'cdp' and 'sales', each with an information icon.

Resource Pool	Memory	CPU	GPU
marketing	200 GB	50 Cores	2 Cores
cdp	100 GB	20 Cores	1 Cores
sales	100 GB	20 Cores	1 Cores

root.default.marketing

Memory:

- Total: 200 GB
- Available: 200 GB
- 0% allocated

CPU:

- Total: 50 Cores
- Available: 50 Cores
- 0% allocated

GPU:

- Total: 2 Cores
- Available: 2 Cores
- 0% allocated

Validity: 2022-11-28T19:45Z
Distribution Policy: INELASTIC

Sorting the resource pool display

Click the Sort by drop down list and select a sorting option to sort the resource pools within each level.
