## Introduction to the CCP Runbook

After installing Cloudera Cybersecurity Platform, you must set up Cloudera Cybersecurity Platform (CCP) to monitor your data. To set up CCP you must add new telemetry data sources, enrich telemetry events, triage threat intelligence information, and ensure telemetry events are viewable in the user interface.

Unlike other CCP documentation, the Runbook provides detailed examples that are populated with information specific to the Squid data source. Squid is a caching proxy for the Web supporting HTTP, HTTPS, FTP, and more. It reduces bandwidth and improves response times by caching and reusing frequently-requested web pages.

The following sections guide you through how to add the Squid telemetry to CCP. The following procedures use the Management module UI whenever possible. If you would like to see these steps performed using the CLI, see the CCP Administration Guide.
